Emerging & Evolving Languages

- Inspired by Shade Trees [Cook 1984] & Renderman Shading Language [1980's]:
 - RTSL [Stanford 2001] real-time shading language
 - Cg [NVIDIA 2003] "C for graphics"
 - HLSL [Microsoft 2003] Direct X
 - GLSL [OpenGL ARB 2004] OpenGL 2.0
 - Optix [NVIDIA 2009] Real time ray tracing engine for CUDA
- General Purpose GPU computing
 - CUDA [NVIDIA 2007]
 - OpenCL (Open Computing Language) [Apple 2008] for heterogeneous platforms of CPUs & GPUs

Cg Design Goals

- Ease of programming
 - "Cg: A system for programming graphics hardware in a C-like language" Mark et al. SIGGRAPH 2003
- Complete support for hardware functionality
- Performance

• Portability

- Minimal interference with application data
- Ease of adoption
- Extensibility for future hardware
- Support for non-shading uses of the GPU

Cg Design

- Hardware is changing rapidly [2003]... no single standard
- Specify "profile" for each hardware
 - May omit support of some language capabilities (e.g., texture lookup in vertex processor)
- Use hardware virtualization or emulation?
 - "Performance would be so poor it would be worthless for most applications"
 - Well, it might be ok for general purpose programming (not real-time graphics)

Cg compiler vs. GPU assembly

- Can inspect the assembly language produced by Cg compiler and perform additional optimizations by hand
 - Generally once development is complete (& output is correct)
- Using Cg is easier than writing GPU assembly from scratch

(Typical) Language Design Issues

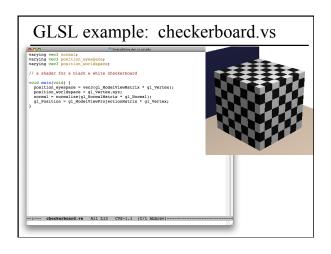

- Parameter binding
- Call by reference vs. call by value
- Data types: 32 bit float, 16 bit float, 12 bit fixed & type-promotion (aim for performance)
- Specialized arrays or general-purpose arrays

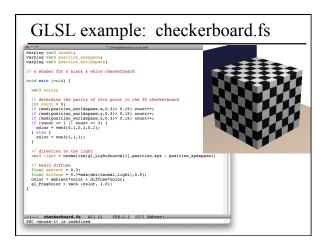

- float4 x VS. float x[4]

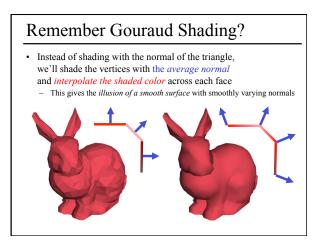

- Indirect addressing/pointers (not allowed...)
- Recursion (not allowed...)

- Many "Mapping" techniques
 - Bump Mapping
 - Normal Mapping - Displacement Mapping - Parallax Mapping
 - Environment Mapping - Parallax Occlusion Mapping
 - Light Mapping

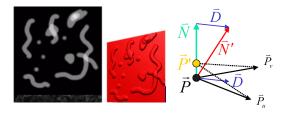

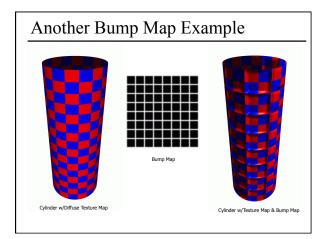

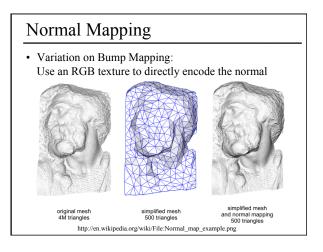

Bump Mapping

- Treat a greyscale texture as a single-valued height function
- Compute the normal from the partial derivatives in the texture

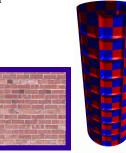

What's Missing?

- There are no bumps on the silhouette of a bump-mapped or normal-mapped object
- Bump/Normal maps don't allow self-occlusion or self-shadowing

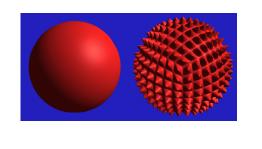

Today

- Shader Programming Languages
- · Gouraud Shading vs. Phong Normal Interpolation
- Many "Mapping" techniques
 - Normal Mapping
 - Displacement Mapping - Parallax Mapping
 - Environment Mapping - Parallax Occlusion Mapping
 - Light Mapping

- Bump Mapping

Displacement Mapping

- Use the texture map to actually move the surface point
- · The geometry must be displaced before visibility is determined

Geometry Caching for Ray-Tracing Displacement Maps EGRŴ 1996 Matt Pharr and Pat Hanrahan

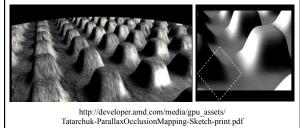

note the detailed shadows cast by the stones

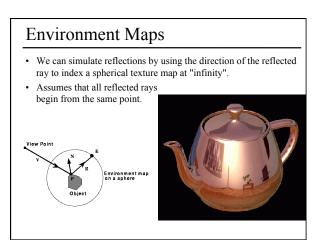

Parallax Occlusion Mapping

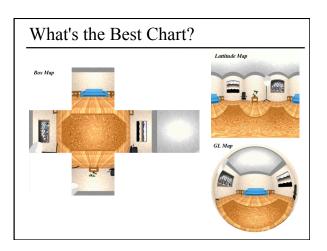

- Brawley & Tatarchuk 2004
- Per pixel ray tracing of the heightfield geometry
- Occlusions & soft shadows
