Propositional Logic

- Assigning truth values to logical propositions.
- Formula syntax:

f	::=	v	symbol
	|	$f \wedge f$	and
	|	$f \vee f$	or
	|	$f \Leftrightarrow f$	if and only if
	|	$f \Rightarrow f$	implies
	|	$\neg f$	not

Truth Values

- To assign a truth values to a propositional formula, we have to assign truth values to each of its atoms (symbols).
- Formula semantics:

a	b	$a \wedge b$	$a \vee b$	$a \Leftrightarrow b$	$a \Rightarrow b$	$\neg\ a$
False	False	F	F	T	T	T
False	True	F	T	F	T	T
True	False	F	T	F	F	F
True	True	T	T	T	T	F

Tautologies

- A *tautology* is a formula, true for all possible assignments.

- For example: $\neg\neg p \Leftrightarrow p$

- The contrapositive law:

$$(p \Rightarrow q) \Leftrightarrow (\neg q \Rightarrow \neg p)$$

- De Morgan's law:

$$\neg (p \wedge q) \Leftrightarrow (\neg p \vee \neg q)$$

First Order Predicate Calculus

- Adds variables, terms, and (first-order) quantification of variables.
- Predicate syntax:

a	::=	$p(v_1, v_2, \ldots, v_n)$	predicate

| f	::=	a	atom
	|	$v = p(v_1, v_2, \ldots, v_n)$	equality
	|	$v_1 = v_2$	
	|	$f \wedge f$ | $f \vee f$ | $f \Leftrightarrow f$ | $f \Rightarrow f$ | $\neg f$	
	|	$\forall v . f$	universal quantifier
	|	$\exists v . f$	existential quantifier

Predicate Calculus

- In mathematical logic, a *predicate* is a function that maps constants or variables to true and false.
- Predicate calculus enables reasoning about propositions.

- For example:

$$\forall C\ [rainy(C) \wedge cold(C) \Rightarrow snowy(C)]$$

Quantifier ($\forall, \exists$)

Operators ($\wedge, \vee, \Leftrightarrow, \Rightarrow, \neg$)

Quantifiers

- *Universal* (∀) quantifier indicates that the proposition is true for **all** variable values.

- *Existential* (∃) quantifier indicates that the proposition is true for **at least one** value of the variable.

- For example:

  ∀A ∀B [∃C [takes(A,C) ∧ takes(B,C)] ⇒
          classmates(A,B)]

Structural Congruence Laws

P₁ ⇒ P₂ ≡ ¬P₁ ∨ P₂

¬∃X [P(X)] ≡ ∀X [¬P(X)]
¬∀X [P(X)] ≡ ∃X [¬P(X)]

¬(P₁ ∧ P₂) ≡ ¬P₁ ∨ ¬P₂
¬(P₁ ∨ P₂) ≡ ¬P₁ ∧ ¬P₂
¬¬P ≡ P

(P₁ ⇔ P₂) ≡ (P₁ ⇒ P₂) ∧ (P₂ ⇒ P₁)

P₁ ∨ (P₂ ∧ P₃) ≡ (P₁ ∨ P₂) ∧ (P₁ ∨ P₃)
P₁ ∧ (P₂ ∨ P₃) ≡ (P₁ ∧ P₂) ∨ (P₁ ∧ P₃)

P₁ ∨ P₂ ≡ P₂ ∨ P₁

Clausal Form

- Looking for a *minimal kernel* appropriate for theorem proving.
- Propositions are transformed into normal form by using structural congruence relationship.
- One popular normal form candidate is *clausal form*.
- Clocksin and Melish (1994) introduce a 5-step procedure to convert first-order logic propositions into clausal form.

Clocksin and Melish Procedure

1. Eliminate implication (⇒) and equivalence (⇔).
2. Move negation (¬) inwards to individual terms.
3. *Skolemization*: eliminate existential quantifiers (∃).
4. Move universal quantifiers (∀) to top-level and make implicit , i.e., all variables are universally quantified.
5. Use distributive, associative and commutative rules of ∨, ∧, and ¬, to move into *conjuctive normal form*, i.e., a conjuction of disjunctions (or *clauses*.)

Example

∀A [¬student(A) ⇒ (¬dorm_resident(A) ∧
        ¬∃B [takes(A,B) ∧ class(B)])]

1. Eliminate implication (⇒) and equivalence (⇔).

∀A [student(A) ∨ (¬dorm_resident(A) ∧
        ¬∃B [takes(A,B) ∧ class(B)])]

2. Move negation (¬) inwards to individual terms.

∀A [student(A) ∨ (¬dorm_resident(A) ∧
        ∀B [¬(takes(A,B) ∧ class(B))])]

∀A [student(A) ∨ (¬dorm_resident(A) ∧
        ∀B [¬takes(A,B) ∨ ¬class(B)])]

Example Continued

∀A [student(A) ∨ (¬dorm_resident(A) ∧
        ∀B [¬takes(A,B) ∨ ¬class(B)])]

3. *Skolemization*: eliminate existential quantifiers (∃).
4. Move universal quantifiers (∀) to top-level and make implicit , i.e., all variables are universally quantified.

student(A) ∨ (¬dorm_resident(A) ∧
        (¬takes(A,B) ∨ ¬class(B))

5. Use distributive, associative and commutative rules of ∨, ∧, and ¬, to move into *conjuctive normal form*, i.e., a conjuction of disjunctions (or *clauses*.)

(student(A) ∨ ¬dorm_resident(A)) ∧
(student(A) ∨ ¬takes(A,B) ∨ ¬class(B))

Clausal Form to Prolog

```
(student(A) ∨ ¬dorm_resident(A)) ∧
(student(A) ∨ ¬takes(A,B) ∨ ¬class(B))
```

6. Use commutativity of ∨ to move negated terms to the right of each clause.
7. Use $P_1 ∨ ¬P_2 ≡ P_2 ⇒ P_1 ≡ P_1 ⇐ P_2$

```
(student(A) ⇐ dorm_resident(A)) ∧
(student(A) ⇐ ¬(¬takes(A,B) ∨ ¬class(B))
```

8. Move Horn clauses to Prolog:

```
student(A) :- dorm_resident(A).
student(A) :- takes(A,B),class(B).
```

C. Varela   13

Skolemization

```
∃X [takes(X,cs101) ∧ class_year(X,2)]
```

introduce a Skolem constant to get rid of existential quantifier (∃):

```
takes(x,cs101) ∧ class_year(x,2)
```

```
∀X [¬dorm_resident(X) ∨
    ∃A [campus_address_of(X,A)]]
```

introduce a Skolem function to get rid of existential quantifier (∃):

```
∀X [¬dorm_resident(X) ∨
    campus_address_of(X,f(X)]
```

C. Varela   14

Limitations

- If more than one non-negated (positive) term in a clause, then it cannot be moved to a Horn clause (which restricts clauses to only one head term).

- If zero non-negated (positive) terms, the same problem arises (Prolog's inability to prove logical negations).

- For example:
  - « every living thing is an animal or a plant »

```
animal(X) ∨ plant(X) ∨ ¬living(X)
animal(X) ∨ plant(X) ⇐ living(X)
```

C. Varela   15

Exercises

4. What is the logical meaning of the second Skolemization example if we do not introduce a Skolem function?
5. Convert the following predicates into Conjunctive Normal Form, and if possible, into Horn clauses:
   a) ∀C [rainy(C) ∧ cold(C) ⇒ snowy(C)]
   b) ∃C [¬snowy(C)]
   c) ¬∃C [snowy(C)]
6. PLP Exercise 11.5 (pg 571).
7. PLP Exercise 11.6 (pg 571).
