Logic Programming (PLP 11.3)

Prolog: Arithmetic, Equalities, Operators, I/O, Natural Language Parsing

Carlos Varela
Rennselaer Polytechnic Institute

September 11, 2009

Arithmetic Goals

```
N>M
N<M
N=<M
N>=M
```

- `N` and `M` must be bound to numbers for these tests to *succeed* or *fail*.
- `X is 1+2` is used to *assign* numeric value of right-hand-side to variable in left-hand-side.

Loop Revisited

```
natural(1).
natural(N) :- natural(M), N is M+1.
my_loop(N) :- N>0,
              natural(I), I=<N,
              write(I), nl,
              I=N,
              !.
```

Also called *generate-and-test*.

= is not equal to == or =:=

`X=Y` `X\=Y`
test whether `X` and `Y` **can be** or **cannot be** *unified*.

`X==Y` `X\==Y`
test whether `X` and `Y` are currently *co-bound*, i.e., have been bound to, or share the same value.

`X=:=Y` `X=\=Y`
test *arithmetic* equality and inequality.

More equalities

`X=@=Y` `X\=@=Y`
test whether `X` and `Y` are *structurally identical*.

- `=@=` is weaker than `==` but stronger than `=`.
- Examples:

```
a=@=A              false
A=@=B              true
x(A,A)=@=x(B,C)    false
x(A,A)=@=x(B,B)    true
x(A,B)=@=x(C,D)    true
```

More on equalities

`X==Y`
⇒ `X=@=Y`
⇒ `X=Y`

but not the other way (⇐).

- If two terms are currently co-bound, they are structurally identical, and therefore they can unify.
- Examples:

```
a=@=A              false
A=@=B              true
x(A,A)=@=x(B,C)    false
x(A,A)=@=x(B,B)    true
x(A,B)=@=x(C,D)    true
```

Prolog Operators

`:- op(P,T,O)`
declares an operator symbol `O` with precedence `P` and type `T`.

- Example:

```
:- op(500,xfx,'has_color')
a has_color red.
b has_color blue.
```

then:

```
?- b has_color C.
C = blue.
?- What has_color red.
What = a.
```

Operator precedence/type

- Precendence **`P`** is an integer: the larger the number, the less the precedence (*ability to group*).
- Type **`T`** is one of:

`T`	Position	Associativity	Examples
`xfx`	Infix	Non-associative	`is`
`xfy`	Infix	Right-associative	`, ;`
`yfx`	Infix	Left-associative	`+ - * /`
`fx`	Prefix	Non-associative	`?-`
`fy`	Prefix	Right-associative	
`xf`	Postfix	Non-associative	
`yf`	Postfix	Left-associative	

Testing types

`atom``(X)`
tests whether `X` is an *atom*, e.g., `'foo'`, `bar`.

`integer``(X)`
tests whether `X` is an *integer*; it does not test for complex terms, e.g., `integer(4/2)` fails.

`float``(X)`
tests whether `X` is a *float*; it matches exact type.

`string``(X)`
tests whether `X` is a *string*, enclosed in `` `` ... `` ``.

Prolog Input

`seeing``(X)`
succeeds if `X` is (or can be) bound to *current read port*. `X = user` is keyboard (standard input.)

`see``(X)`
opens port for input file bound to `X`, and makes it *current*.

`seen`
closes current port for input file, and makes `user` *current*.

`read``(X)`
reads Prolog type expression from *current* port, storing value in `X`.

`end-of-file`
is returned by **`read`** at *<end-of-file>*.

Prolog Output

`telling``(X)`
succeeds if `X` is (or can be) bound to *current output port*. `X = user` is screen (standard output.)

`tell``(X)`
opens port for output file bound to `X`, and makes it *current*.

`told`
closes current output port, and reverses to screen output (makes `user` *current*.)

`write``(X)`
writes Prolog expression bound to `X` into *current* output port.

`nl`
new line (line feed).

`tab``(N)`
writes `N` spaces to current output port.

I/O Example

```
browse(File) :-
  seeing(Old),          /* save for later */
  see(File),            /* open this file */
  repeat,
  read(Data),           /* read from File */
  process(Data),
  seen,                 /* close File */
  see(Old),             /* prev read source */
  !.                    /* stop now */

process(end_of_file) :- !.
process(Data) :-  write(Data), nl, fail.
```

First-Class Terms Revisited

`call(P)`	Invoke predicate as a goal.
`assert(P)`	Adds predicate to database.
`retract(P)`	Removes predicate from database.
`functor(T,F,A)`	Succeeds if `T` is a *term* with *functor* `F` and *arity* `A`.
`clause(H,B)`	Succeeds if the clause `H :- B` can be found in the database.

Key Points Regarding Flue Epidemics

- Wash your hands often, especially after shaking hands with others (use hand disinfectants if there is no access to soap and water).
- Avoid close contact with people who are sick.
- Cover your mouth and nose with a tissue when coughing or sneezing. If you don't have a tissue, use the inside of your elbow.
- Do not touch your eyes, nose, or mouth, especially after contact with shared keyboards, microscopes, instruments, or other people.
- **STAY HOME if you have flu-like symptoms,** i.e., fever (100 degrees F [37.8 degrees C] or higher), cough, sore throat, runny or stuffy nose, body aches, headache, chills, fatigue.
- For more information: http://www.rpi.edu/about/flu/

Natural Language Parsing

(Example from "Learn Prolog Now!" Online Tutorial)

```
word(article,a).
word(article,every).
word(noun,criminal).
word(noun,'big kahuna burger').
word(verb,eats).
word(verb,likes).

sentence(Word1,Word2,Word3,Word4,Word5) :-
      word(article,Word1),
      word(noun,Word2),
      word(verb,Word3),
      word(article,Word4),
      word(noun,Word5).
```

Parsing natural language

- *Definite Clause Grammars (DCG)* are useful for natural language parsing.
- Prolog can load DCG rules and convert them automatically to Prolog parsing rules.

DCG Syntax

`-->`

DCG *operator*, e.g.,

```
sentence-->subject,verb,object.
```

Each goal is assumed to refer to the *head* of a DCG rule.

`{prolog_code}`

Include Prolog code in generated parser, e.g.,

```
subject-->modifier,noun,{write('subject')}.
```

`[terminal_symbol]`

Terminal symbols of the grammar, e.g.,

```
noun-->[cat].
```

Natural Language Parsing

(example rewritten using DCG)

```
sentence --> article, noun, verb, article, noun.

article --> [a] | [every].

noun --> [criminal] | ['big kahuna burger'].

verb --> [eats] | [likes].
```

Exercises

12. How would you translate DCG rules into Prolog rules?
13. PLP Exercise 11.8 (pg 571).
14. PLP Exercise 11.14 (pg 572).
