1

## On Academic Dishonesty

Academic dishonesty policies apply to this course, including:

- Academic Fraud
- Collaboration
- Copying
- Cribbing
- Fabrication
- Plagiarism
- Sabotage
- Substitution

If in doubt, ask the instructor, or see Rensselaer Handbook of Student Rights and Responsibilities at:

<http://www.rpi.edu/dept/doso/handbook.html>

Students found in violation of academic dishonesty policies may receive a failing grade for this course.

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

2

## Sequential declarative computation model

- The **single assignment store**
  - declarative (dataflow) variables
  - partial values (variables and values are also called *entities*)
- The **kernel language syntax**
- The **kernel language semantics**
  - The environment: maps textual variable names (variable identifiers) into entities in the store
  - Interpretation (execution) of the kernel language elements (statements) by the use of an abstract machine
  - Abstract machine consists of an execution stack of statements transforming the store

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

3

## Single assignment store

- A single assignment store is a store (set) of variables
- Initially the variables are unbound, i.e. do not have a defined value
- Example: a store with three variables,  $x_1$ ,  $x_2$ , and  $x_3$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

4

## Single assignment store (2)

- Variables in the store may be bound to values
- Example: assume we allow as values, integers and lists of integers

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

5

## Single assignment store (3)

- Variables in the store may be bound to values
- Assume we allow as values, integers and lists of integers
- Example:  $x_1$  is bound to the integer 314,  $x_2$  is bound to the list [1 2 3], and  $x_3$  is still unbound

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

6

## Declarative (single-assignment) variables

- A declarative variable starts out as being unbound when created
- It can be bound to exactly one value
- Once bound it stays bound through the computation, and is indistinguishable from its value

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

7

## Value store

- A store where all variables are bound to values is called a value store
- Example: a value store where  $x_1$  is bound to integer 314,  $x_2$  to the list [1 2 3], and  $x_3$  to the record (labeled tree) `person(name: "George" age: 25)`
- Functional programming computes functions on values, needs only a value store
- This notion of value store is enough for functional programming (ML, Haskell, Scheme)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

8

## Operations on the store (1) Single assignment

$\langle x \rangle = \langle v \rangle$

- $x_1 = 314$
- $x_2 = [1\ 2\ 3]$
- This assumes that  $\langle x \rangle$  is unbound

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

9

## Single-assignment

$\langle x \rangle = \langle \text{value} \rangle$

- $x_1 = 314$
- $x_2 = [1\ 2\ 3]$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

10

## Single-assignment (2)

$\langle x \rangle = \langle v \rangle$

- $x_1 = 314$
- $x_2 = [1\ 2\ 3]$
- The *single assignment operation* ( $\langle = \rangle$ ) constructs the  $\langle v \rangle$  in the store and binds the variable  $\langle x \rangle$  to this value
- If the variable is already bound, the operation will test the compatibility of the two values
- If the test fails an error is raised

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

11

## Variable identifiers

- Variable identifiers refers to store entities (variables or values)
- The environment maps variable identifiers to variables
- `declare X`
- `local X in ...`
- "X" is a (variable) identifier
- This corresponds to 'environment'  $\{ "X" \rightarrow x_1 \}$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

12

## Variable-value binding revisited (1)

- $X = [1\ 2\ 3]$
- Once bound the variable is indistinguishable from its value

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

13

## Variable-value binding revisited (2)

- $X = [1\ 2\ 3]$
- Once bound the variable is indistinguishable from its value
- The operation of traversing variable cells to get the value is known as *dereferencing* and is invisible to the programmer

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

14

## Partial Values

- A partial value is a data structure that may contain unbound variables
- The store contains the partial value: `person(name: "George" age: x2)`
- `declare Y X`
- `X = person(name: "George" age: Y)`
- The identifier 'Y' refers to  $x_2$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

15

## Partial Values (2)

Partial Values may be complete

- `declare Y X`
- `X = person(name: "George" age: Y)`
- `Y = 25`

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

16

## Variable to variable binding

- $\langle x_1 \rangle = \langle x_2 \rangle$
- It is to perform the bind operation between variables
- Example: `X = Y`
- $X = [1\ 2\ 3]$
- The operation equates (merges) the two variables

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

17

## Variable to variable binding (2)

- $\langle x_1 \rangle = \langle x_2 \rangle$
- It is to perform a single assignment between variables
- Example: `X = Y`
- $X = [1\ 2\ 3]$
- The operation equates the two variables (forming an equivalence class)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

18

## Variable to variable binding (3)

$\langle x_1 \rangle = \langle x_2 \rangle$

- It is to perform a single assignment between variables
- Example:
  - $X = Y$
  - $X = [1\ 2\ 3]$
- All variables (X and Y) are bound to  $[1\ 2\ 3]$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

19

## Summary Variables and partial values

- Declarative variable:
  - is an entity that resides in a single-assignment store, that is initially unbound, and can be bound to exactly one (partial) value
  - it can be bound to several (partial) values as long as they are compatible with each other
- Partial value:
  - is a data-structure that may contain unbound variables
  - when one of the variables is bound, it is replaced by the (partial) value it is bound to
  - a complete value, or *value* for short is a data structure that does not contain any unbound variables

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

20

## Declaration and use of variables

- Assume that variables can be declared (introduced) and used separately
- What happens if we try to use a variable before it is bound?
  1. Use whatever value happens to be in the memory cell occupied by the variable (C, C++)
  2. The variable is initialized to a default value (Java), use the default
  3. An error is signaled (Prolog). Makes sense if there is a single activity running (pure sequential programs)
  4. An attempt to use the variable will wait (suspends) until another activity binds the variable (Oz/Mozart)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

21

## Declaration and use of variables (2)

- An attempt to use the variable will wait (suspends) until another activity binds the variable (Oz/Mozart)
- Declarative (single assignment) variables that have this property are called *dataflow* variables
- It allows multiple operations to proceed concurrently giving the correct result
- Example:  $A = 23$  running concurrently with  $B = A + 1$
- Functional (concurrent) languages do not allow the separation between declaration and binding (ML, Haskell, and Erlang)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

22

## Kernel language syntax

The following defines the syntax of a statement,  $\langle s \rangle$  denotes a statement

```

⟨s⟩ ::= skip                               empty statement
      | ⟨x⟩ = ⟨y⟩                             variable-variable binding
      | ⟨x⟩ = ⟨v⟩                             variable-value binding
      | ⟨s1⟩ ⟨s2⟩                             sequential composition
      | local ⟨x⟩ in ⟨s1⟩ end                 declaration
      | if ⟨x⟩ then ⟨s1⟩ else ⟨s2⟩ end        conditional
      | { ⟨x⟩ ⟨y1⟩ ... ⟨yn⟩ }                procedural application
      | case ⟨x⟩ of ⟨pattern⟩ then ⟨s1⟩ else ⟨s2⟩ end pattern matching

⟨v⟩ ::= ...                                 value expression

⟨pattern⟩ ::= ...
    
```

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

23

## Variable identifiers

- $\langle x \rangle$ ,  $\langle y \rangle$ ,  $\langle z \rangle$  stand for variables
- In the concrete kernel language variables begin with uppercase letter followed by a (possibly empty) sequence of alphanumeric characters or underscore
- Any sequence of printable characters within back-quote
- Examples:
  - X
  - Y1
  - Hello\_World
  - 'hello this is a \$5 bill' (back-quote)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

24

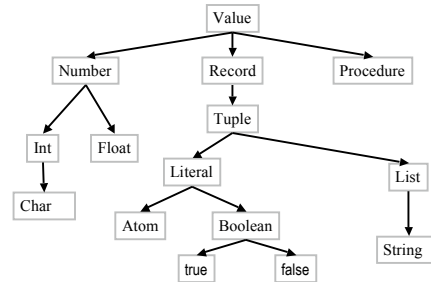

## Values and types

- A *data type* is a set of values and a set of associated operations
- Example: Int is the the data type "Integer", i.e set of all integer values
- 1 is *of type* Int
- Int has a set of operations including +,-,\*,div, etc
- The model comes with a set of basic types
- Programs can define other types, e.g., *abstract data types* ADT

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

25

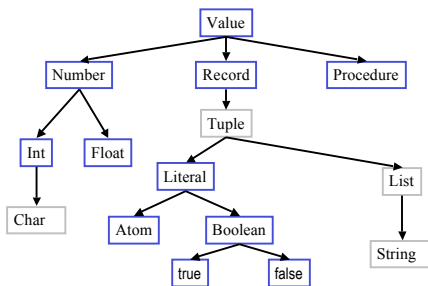

## Data types

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

26

## Data types (2)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

27

## Value expressions

```

⟨v⟩ ::= ⟨procedure⟩ | ⟨record⟩ | ⟨number⟩

⟨procedure⟩ ::= proc '{ $ ⟨v₁⟩ ... ⟨vₙ⟩ }' ⟨s⟩ end

⟨record⟩, ⟨pattern⟩ ::= ⟨literal⟩
                    | ⟨literal⟩ [(⟨feature₁⟩ : ⟨x₁⟩ ... ⟨featureₙ⟩ : ⟨xₙ⟩)]

⟨literal⟩ ::= ⟨atom⟩ | ⟨bool⟩
⟨feature⟩ ::= ⟨int⟩ | ⟨atom⟩ | ⟨bool⟩

⟨bool⟩ ::= true | false

⟨number⟩ ::= ⟨int⟩ | ⟨float⟩
    
```

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

28

## Numbers

- Integers
  - 314, 0
  - ~10 (minus 10)
- Floats
  - 1.0, 3.4, 2.0e2, 2.0E2 ( $2 \times 10^2$ )

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

29

## Atoms and booleans

- A sequence starting with a lower-case character followed by characters or digits, ...
  - person, peter
  - 'Seif Haridi'
- Booleans:
  - true
  - false

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

30

## Records

- Compound representation (data-structures)
  - $\langle f \rangle(\langle f_1 \rangle : \langle x_1 \rangle \dots \langle f_n \rangle : \langle x_n \rangle)$
  - $\langle f \rangle$  is a literal
- Examples
  - person(age:X1 name:X2)
  - person(1:X1 2:X2)
  - '(1:H 2:T)
  - nil
  - person

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

31

## Syntactic sugar (tuples)

- Tuples
  - $\langle f \rangle(\langle x_1 \rangle \dots \langle x_n \rangle)$  (tuple)
- This is equivalent to the record
  - $\langle f \rangle(1: \langle x_1 \rangle \dots n: \langle x_n \rangle)$
- Example:
  - person('George' 25)
- This is the record
  - person(1:'George' 2:25)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

32

## Syntactic sugar (lists)

- Lists
  - $\langle x_1 \rangle | \langle x_2 \rangle$  (a cons with the infix operator '|')
- This is equivalent to the tuple
  - '|'( $\langle x_1 \rangle \langle x_2 \rangle$ )
- Example:
  - H | T
- This is the tuple
  - '|(H T)

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

33

## Syntactic sugar (lists)

- Lists
  - $\langle x_1 \rangle | \langle x_2 \rangle | \langle x_3 \rangle$
- '|' associates to the right
  - $\langle x_1 \rangle | (\langle x_2 \rangle | \langle x_3 \rangle)$
- Example:
  - 1 | 2 | 3 | nil
- Is
  - 1 | (2 | (3 | nil))

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

34

## Syntactic sugar (complete lists)

- Complete lists
- Example:
  - [1 2 3]
- Is
  - 1 | (2 | (3 | nil))

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

35

## Strings

- A string is a list of character codes enclosed with double quotes
- Ex: "E=mc^2"
- Means the same as [69 61 109 99 94 50]

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

36

## Procedure declarations

- According to the kernel language  
 $\langle x \rangle = \text{proc } \{ \$ \langle y_1 \rangle \dots \langle y_n \rangle \} \langle s \rangle \text{ end}$   
is a legal statement
- It binds  $\langle x \rangle$  to a procedure value
- This statement actually declares (introduces) a procedure
- Another syntactic variant which is more familiar is  
 $\text{proc } \{ \langle x \rangle \langle y_1 \rangle \dots \langle y_n \rangle \} \langle s \rangle \text{ end}$
- This introduces (declares) the procedure  $\langle x \rangle$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

37

## Operations of basic types

- Arithmetics
  - Floating point numbers: +, -, \*, and /
  - Integers: +, -, \*, div (integer division, i.e. truncate fractional part), mod (the remainder after a division, e.g.  $10 \bmod 3 = 1$ )
- Record operations
  - Arity, Label, and "."
  - $X = \text{person}(\text{name}:"George" \text{ age}:25)$
  - $\{\text{Arity } X\} = [\text{age name}]$
  - $\{\text{Label } X\} = \text{person}, X.\text{age} = 25$
- Comparisons
  - Boolean comparisons, including ==, != (equality)
  - Numeric comparisons, ==, <, >, >=, compares integers, floats, and atoms

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

38

## Value expressions

$\langle v \rangle ::= \langle \text{procedure} \rangle \mid \langle \text{record} \rangle \mid \langle \text{number} \rangle \mid \langle \text{basicExpr} \rangle$

$\langle \text{basicExpr} \rangle ::= \dots \mid \langle \text{numberExpr} \rangle \mid \dots$

$\langle \text{numberExpr} \rangle ::= \langle x \rangle_1 + \langle x \rangle_2 \mid \dots$

.....

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

39

## Syntactic sugar (multiple variables)

- Multiple variable introduction

$\text{local } X Y \text{ in } \langle \text{statement} \rangle \text{ end}$

- is transformed to

$\text{local } X \text{ in}$   
 $\text{local } Y \text{ in } \langle \text{statement} \rangle \text{ end}$   
 $\text{end}$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

40

## Syntactic sugar (basic expressions)

- Basic expression nesting

$\text{if } \langle \text{basicExpr} \rangle \text{ then } \langle \text{statement} \rangle_1 \text{ else } \langle \text{statement} \rangle_2 \text{ end}$

- is transformed to

$\text{local } T \text{ in}$   
 $T = \langle \text{basicExpr} \rangle$   
 $\text{if } T \text{ then } \langle \text{statement} \rangle_1 \text{ else } \langle \text{statement} \rangle_2 \text{ end}$   
 $\text{end}$

- where T is a fresh ('new') variable identifier

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

41

## Syntactic sugar (variables)

- Variable initialization

$\text{local } X = \langle \text{value} \rangle \text{ in } \langle \text{statement} \rangle \text{ end}$

- Is transformed to

$\text{local } X \text{ in}$   
 $X = \langle \text{value} \rangle$   
 $\langle \text{statement} \rangle$   
 $\text{end}$

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

42

## Exercises

42. Using Oz, perform a few basic operations on numbers, records, and booleans (see Appendix B1-B3)
43. Explain the behavior of the `declare` statement in the interactive environment. Give an example of an interactive Oz session where “`declare`” and “`declare ... in`” produce different results. Explain why.
44. VRH Exercise 2.9.1
45. Describe what an anonymous procedure is, and write one in Oz. When are anonymous procedures useful?
