UCL
Sequential declarative computation model

• The kernel language semantics revisited.
  – Suspendable statements:
    • if,
    • case,
    • procedure application.
  – Procedure values
  – Procedure introduction
  – Procedure application.
Conditional

- The semantic statement is
  \[ (\text{if } \langle x \rangle \text{ then } \langle s_1 \rangle \text{ else } \langle s_2 \rangle \text{ end }, E) \]

- If the activation condition \(E(\langle x \rangle)\) is determined) is true:
  - If \(E(\langle x \rangle)\) is not Boolean (true, false), raise an error
  - \(E(\langle x \rangle)\) is true, push \(\langle s_1 \rangle, E\) on the stack
  - \(E(\langle x \rangle)\) is false, push \(\langle s_2 \rangle, E\) on the stack

- If the activation condition \(E(\langle x \rangle)\) is determined) is false:
  - Suspend
Case statement

- The semantic statement is
  \[
  \text{( case } \langle x \rangle \text{ of } \langle l \rangle (\langle f_1 \rangle : \langle x_1 \rangle \ldots \langle f_n \rangle : \langle x_n \rangle)
  \quad \text{then } \langle s_1 \rangle
  \quad \text{else } \langle s_2 \rangle \text{ end }, E)\]

- If the activation condition \((E(\langle x \rangle)\) is determined) is true:
  - If \(E(\langle x \rangle)\) is a record, the label of \(E(\langle x \rangle)\) is \(\langle l \rangle\) and
    its arity is \([\langle f_1 \rangle \ldots \langle f_n \rangle]\), and \(\langle x_1 \rangle \ldots \langle x_n \rangle\) are independent:
      push \((\text{local } \langle x_1 \rangle = \langle x \rangle. \langle f_1 \rangle \ldots \langle x_n \rangle = \langle x \rangle. \langle f_n \rangle \text{ in } \langle s_1 \rangle \text{ end}, E)\)
      on the stack
  - Otherwise, push \((\langle s_2 \rangle, E)\) on the stack

- If the activation condition \((E(\langle x \rangle))\) is determined) is false:
  - Suspend
Procedure values

• Constructing a procedure value in the store is not simple because a procedure may have external references

```
local P Q in
  Q = proc {$} {Browse hello} end
P = proc {$} {Q} end
local Q in
  Q = proc {$} {Browse hi} end
  {P}
end
end
```
local P Q in
  Q = proc ${} \{ \text{Browse hello} \} \text{ end}
  P = \text{ proc }${} \{ Q \} \text{ end
  local Q in
    Q = \text{ proc }${} \{ \text{Browse hi} \} \text{ end
    \{ P \}
  end
end

\begin{align*}
\text{proc }${} \{ Q \} \text{ end} \quad \text{Q} \rightarrow x_2
\end{align*}

\begin{align*}
\text{proc }${} \{ \text{Browse hello} \} \text{ end} \quad \text{Browse} \rightarrow x_0
\end{align*}

\text{Procedure values (2)}
Procedure values (3)

- The semantic statement is
  \((\langle x \rangle = \text{proc} \{ $ \langle y_1 \rangle \ldots \langle y_n \rangle \} \langle s \rangle \text{ end}, E)\)
- \(\langle y_1 \rangle \ldots \langle y_n \rangle\) are the (formal) parameters of the procedure
- Other free identifiers in \(\langle s \rangle\) are called external references \(\langle z_1 \rangle \ldots \langle z_k \rangle\)
- These are defined by the environment \(E\) where the procedure is declared (lexical scoping)
- The contextual environment of the procedure \(CE\) is \(E | \{z_1 \ldots z_k\}\)
- When the procedure is called \(CE\) is used to construct the environment for execution of \(\langle s \rangle\)
Procedure introduction

- The semantic statement is
  \[(\langle x \rangle = \text{proc} \{\$ \langle y_1 \rangle \ldots \langle y_n \rangle \} \langle s \rangle \text{ end}, E)\]
- Create a contextual environment:
  \[CE = E | \{\langle z_1 \rangle \ldots \langle z_k \rangle \}\] where \(\langle z_1 \rangle \ldots \langle z_k \rangle\) are external references in \(\langle s \rangle\).
- Create a new procedure value of the form:
  \[(\text{proc} \{\$ \langle y_1 \rangle \ldots \langle y_n \rangle \} \langle s \rangle \text{ end}, CE)\], refer to it by the variable \(x_P\)
- Bind the store variable \(E(\langle x \rangle)\) to \(x_P\)
- Continue to next execution step
Procedure application

- The semantic statement is
  \[ (\{ \langle x \rangle \langle y_1 \rangle \ldots \langle y_n \rangle \}, E) \]
- If the activation condition \((E(\langle x \rangle))\) is determined) is true:
  - If \(E(\langle x \rangle)\) is not a procedure value, or it is a procedure with arity that is not equal to \(n\), raise an error
  - If \(E(\langle x \rangle)\) is \((\text{proc} \{ \langle z_1 \rangle \ldots \langle z_n \rangle \} \langle s \rangle \text{end}, CE)\), push
    \[ (\langle s \rangle, CE + \{ \langle z_1 \rangle \rightarrow E(\langle y_1 \rangle) \ldots \langle z_n \rangle \rightarrow E(\langle y_n \rangle) \}) \]
    on the stack
- If the activation condition \((E(\langle x \rangle))\) is determined) is false:
  - Suspend
Execution examples

\[
\langle s \rangle_1 \quad \left\{ \begin{array}{l}
\langle s \rangle_2 \\
\langle s \rangle_3
\end{array} \right. \\
\text{local Max C in} \\
\text{proc \{Max X Y Z\} } \\
\text{if X >= Y then Z=X else Z=Y end} \\
\text{end} \\
\text{end}
\]

\[\{\text{Max 3 5 C}\}\]

\[\langle s \rangle_1 \quad \left\{ \begin{array}{l}
\langle s \rangle_2 \\
\langle s \rangle_3
\end{array} \right. \\
\text{local Max C in} \\
\text{proc \{Max X Y Z\} } \\
\text{if X >= Y then Z=X else Z=Y end} \\
\text{end} \\
\text{end} \]
Execution examples (2)

\[
\begin{align*}
\langle s \rangle_1 & \quad \left\{ \begin{array}{l}
\text{local Max C in} \\
\text{proc \{Max X Y Z\}} \\
\text{if } X \geq Y \text{ then } Z = X \text{ else } Z = Y \text{ end}
\end{array} \right.
\end{align*}
\]

\[
\langle s \rangle_4 \{\text{Max 3 5 C}\}
\end{align*}
\]

• Initial state (\(((\langle s \rangle_1, \emptyset)], \emptyset)\)
• After local Max C in …
  \((\(((\langle s \rangle_2, \{\text{Max } m, \text{ C } c}\})], \{m, c\})\)
• After Max binding
  \((\(((\langle s \rangle_4, \{\text{Max } m, \text{ C } c}\})], \{m = (\text{proc}\{X Y Z\} \langle s \rangle_3 \text{ end }, \emptyset), c\})\)
Execution examples (3)

\[
\begin{align*}
\langle s \rangle_1 & \begin{cases} 

\langle s \rangle_2 & \text{local Max C in} \\
\langle s \rangle_3 & \text{proc \{Max X Y Z\}} \\
\langle s \rangle_4 & \text{if } X \geq Y \text{ then } Z=X \text{ else } Z=Y \text{ end} \\
\{m = (\text{proc}\{$X Y Z$} \langle s \rangle_3 \text{ end} , \emptyset) , c\} \\
\end{cases} \\
\end{align*}
\]

- After Max binding
  
  \[
  ( [(\langle s \rangle_4 , \{\text{Max } \rightarrow m, \text{ C } \rightarrow c\})], \\
  \{m = (\text{proc}\{$X Y Z$} \langle s \rangle_3 \text{ end} , \emptyset) , c\} ) 
  \]

- After procedure call
  
  \[
  ( [(\langle s \rangle_3 , \{X \rightarrow t_1, Y \rightarrow t_2, Z \rightarrow c\}) ] , \\
  \{m = (\text{proc}\{$X Y Z$} \langle s \rangle_3 \text{ end} , \emptyset) , t_1=3, t_2=5, c\} ) 
  \]
Execution examples (4)

local Max C in
  proc {Max X Y Z}
    \(\langle s\rangle_3\)
    if X >= Y then Z=X else Z=Y end
  end
\(\langle s\rangle_4\) {Max 3 5 C}
end

- After procedure call
  \(\langle s\rangle_1\) \(\langle s\rangle_2\)
  \(\langle s\rangle_3\)
  if X >= Y then Z=X else Z=Y end
  \(\langle s\rangle_4\) {Max 3 5 C}
end

\(\langle s\rangle_1\) \(\langle s\rangle_2\)

- After T = (X>=Y)
  \(\langle s\rangle_3\)
  if X >= Y then Z=X else Z=Y end
  \(\langle s\rangle_4\) {Max 3 5 C}
end

\(\langle s\rangle_1\) \(\langle s\rangle_2\)

- After procedure call
  \(\langle s\rangle_3\)
  if X >= Y then Z=X else Z=Y end
  \(\langle s\rangle_4\) {Max 3 5 C}
end

\(\langle s\rangle_1\) \(\langle s\rangle_2\)
Execution examples (5)

\begin{itemize}
\item \(( (Z=Y \, , \, \{X \to t_1, \, Y \to t_2, \, Z \to c, \, T \to t \} ) ) \),
\{m = (\text{proc}\{\$ X \, Y \, Z\} \, \langle s \rangle_3 \, \text{end} \, , \, \emptyset) \, , \, t_1=3, \, t_2=5, \, c, \, t=\text{false} \} \)
\item \(( [ ] ) ,
\{m = (\text{proc}\{\$ X \, Y \, Z\} \, \langle s \rangle_3 \, \text{end} \, , \, \emptyset) \, , \, t_1=3, \, t_2=5, \, c=5, \, t=\text{false} \} \)
\end{itemize}
Procedures with external references

\[ \langle s \rangle_1 \begin{cases} \langle s \rangle_2 \\ \langle s \rangle_3 \end{cases} \]

local LB Y C in
Y = 5
proc \{LB X Z\}
if X >= Y then Z=X else Z=Y end
end
end

\{LB 3 C\}
Procedures with external references

\[
\begin{align*}
\langle s \rangle_1 \quad \langle s \rangle_2 \quad \langle s \rangle_3 \quad \text{if } X \geq Y \text{ then } Z = X \text{ else } Z = Y \text{ end} \\
\text{local LB Y C in} \\
Y = 5 \\
\text{proc } \{ \text{LB } X \ Z \} \\
\text{end} \\
\{ \text{LB } 3 \ \ C \} \\
\text{end}
\end{align*}
\]

- The procedure value of LB is
- \( (\text{proc}\{ X \ Z \} \langle s \rangle_3 \text{ end} , \{Y \rightarrow y\}) \)
- The store is \( \{y = 5, \ldots\} \)
Procedures with external references

\[
\begin{aligned}
\langle s \rangle_1 & \quad \langle s \rangle_2 \quad \langle s \rangle_3 \\
\text{local LB Y C in} & \\
Y &= 5 \\
\text{proc}\{LB X Z\} & \\
\text{if} \; X \geq Y \; \text{then} \; Z=X \; \text{else} \; Z=Y \; \text{end} & \\
\text{end} & \\
\{LB \, 3 \, C\} & \\
\end{aligned}
\]

- The procedure value of LB is \((\text{proc}\{X \, Z\} \langle s \rangle_3 \text{ end} , \{Y \rightarrow y\})\)
- The store is \(\{y = 5, \ldots\}\)
- STACK: \([ (\{LB \, T \, C\} , \{Y \rightarrow y , LB \rightarrow lb , C \rightarrow c , T \rightarrow t\}) ]\)
- STORE: \(\{y = 5 , \, lb = (\text{proc}\{X \, Z\} \langle s \rangle_3 \text{ end} , \{Y \rightarrow y\}) , t = 3 , c\}\)
Procedures with external references

\[
\begin{align*}
\langle s \rangle_1 & \quad \{ \text{LB T C in} \\
& \quad \langle s \rangle_2 \quad \langle s \rangle_3 \quad \text{if } X \geq Y \text{ then } Z=X \text{ else } Z=Y \text{ end} \\
& \quad \{ \text{LB 3 C} \} \\
& \end{align*}
\]

- **STACK:** \([ ( \{ \text{LB T C} \} , \{ Y \rightarrow y , \text{LB} \rightarrow lb , \text{C} \rightarrow c , \text{T} \rightarrow t \} ) ) \]
- **STORE:** \( \{ y = 5 , \ lb = ( \text{proc} \{ X \rightarrow Z \} \langle s \rangle_3 \text{end} , \{ Y \rightarrow y \} ) , t = 3 , c \} \)
- **STACK:** \([ (\langle s \rangle_3 , \{ Y \rightarrow y , X \rightarrow t , Z \rightarrow c \} ) ] \)
- **STORE:** \( \{ y = 5 , \ lb = ( \text{proc} \{ X \rightarrow Z \} \langle s \rangle_3 \text{end} , \{ Y \rightarrow y \} ) , t = 3 , c \} \)
Procedures with external references

\[
\begin{align*}
\langle s\rangle_1 & \quad \begin{cases} 
\text{local LB Y C in} \\

Y = 5 \\
\text{proc \{} LB X Z \text{\}} \\
\text{if } X \geq Y \text{ then } Z = X \text{ else } Z = Y \text{ end} \\
\text{end} \\
\text{end} \\
\end{cases} \\
\langle s\rangle_2 & \\
\langle s\rangle_3 & \\
\end{align*}
\]

- \text{STACK: } [\langle s\rangle_3, \{Y \to y, X \to t, Z \to c\}]$
- \text{STORE: } \{y = 5, \text{lb} = (\text{proc}\{X Z\} \langle s\rangle_3 \text{ end}, \{Y \to y\}), t = 3, c\}$
- \text{STACK: } [(Z = Y, \{Y \to y, X \to t, Z \to c\})]$
- \text{STORE: } \{y = 5, \text{lb} = (\text{proc}\{X Z\} \langle s\rangle_3 \text{ end}, \{Y \to y\}), t = 3, c\}$
- \text{STACK: } [ ]$
- \text{STORE: } \{y = 5, \text{lb} = (\text{proc}\{X Z\} \langle s\rangle_3 \text{ end}, \{Y \to y\}), t = 3, c = 5\}$
From the kernel language to a practical language

• Interactive interface
  – the declare statement and the global environment

• Extend kernel syntax to give a full, practical syntax
  – nesting of partial values
  – implicit variable initialization
  – expressions
  – nesting the if and case statements
  – andthen and orelse operations

• Linguistic abstraction
  – Functions

• Exceptions
The interactive interface (declare)

- The interactive interface is a program that has a single global environment

\[ \text{declare } X \ Y \]

- Augments (and overrides) the environment with new mappings for \( X \) and \( Y \)

\{Browse X\}

- Inspects the store and shows partial values, and incremental changes
The interactive interface (declare)
C. Varela; Adapted w/permission from S. Haridi and P. Van Roy

```
declare X Y
```

```

```
Syntactic extensions

- **Nested partial values**
  - `person(name: “George” age:25)
    local A B in A= “George” B=25 person(name:A age:B) end`

- **Implicit variable initialization**
  - `local ⟨pattern⟩ = ⟨expression⟩ in ⟨statement⟩ end`

- **Example:**
  assume T has been defined, then
  `local tree(key:A left:B right:C value:D) = T in ⟨statement⟩ end`
  is the same as:
  `local A B C D in
    T = tree(key:A left:B right:C value:D) ⟨statement⟩
  end`
Extracting fields in local statement

declare T

: T = tree(key:seif age:48 profession:professor)

: local

  tree(key:A ...) = T

  in

    ⟨statement⟩

end
Nested if and case statements

- Observe a pair notation is: \(1 \# 2\), is the tuple ‘\(\#\)’ (1 2)

```plaintext
case Xs \# Ys
of  nil \# Ys then \(\langle s \rangle_1\)
[ ] Xs \# nil then \(\langle s \rangle_2\)
[ ] (X|Xr) \# (Y|Yr) andthen X=<Y then \(\langle s \rangle_3\)
else \(\langle s \rangle_4\) end
```

- Is translated into (assuming \(X,Xr,Y,Yr\) not free in \(\langle s \rangle_4\))

```plaintext
case Xs of nil then \(\langle s \rangle_1\)
else
case Ys of nil then \(\langle s \rangle_2\)
else
case Xs of X|Xr then
case Ys of Y|Yr then
  if X=<Y then \(\langle s \rangle_3\) else \(\langle s \rangle_4\) end
else \(\langle s \rangle_4\) end
else \(\langle s \rangle_4\) end
end
end
```
Expressions

• An expression is a sequence of operations that returns a value

• A statement is a sequence of operations that does not return a value. Its effect is on the store, or outside of the system (e.g. read/write a file)

• $11*11$  $X=11*11$

  expression  statement
Functions as linguistic abstraction

- $R = \{F \text{ } X_1 \ldots \text{ } X_n\}$
- $\{F \text{ } X_1 \ldots \text{ } X_n \text{ } R\}$

```
fun \{F \text{ } X_1 \ldots \text{ } X_n\} \\
  \langle \text{statement} \rangle \\
  \langle \text{expression} \rangle \\
end
```

```
F = proc \{$ \text{ } X_1 \ldots \text{ } X_n \text{ } R\} \\
  \langle \text{statement} \rangle \\
  R = \langle \text{expression} \rangle \\
end
```
Nesting in data structures

- \( Y_s = \{F\ X\}\|\{\text{Map}\ X_r\ F\}\) 
- Is unnested to:
  - \textbf{local} \( Y\ Y_r \textbf{in} \)
  - \( Y_s = Y\|Y_r \)
  - \{F\ X\ Y\} 
  - \{\text{Map}\ X_r\ F\ Y_r\} 
  - end
- The unnesting of the calls occurs after the data structure
Functional nesting

- Nested notations that allows expressions as well as statements
- `local R in
  {F X1 ... Xn R}
  {Q R ...}
 end`

- Is written as (equivalent to):
- `{Q {F X1 ... Xn} ...}`

  expression

  statement
Conditional expressions

R = if ⟨expr⟩₁ then
   ⟨expr⟩₂
else ⟨expr⟩₃ end

fun {Max X Y}
   if X>=Y then X
   else Y end
end

if ⟨expr⟩₁ then
   R = ⟨expr⟩₂
else R = ⟨expr⟩₃ end

Max = proc {$ X Y R}
   R = ( if X>=Y then X
      else Y end )
end

C. Varela; Adapted w/permission from S. Haridi and P. Van Roy
Example

fun {Max X Y}
  if X>=Y then X
  else Y end
end

Max = proc {$ X Y R}$
  R = ( if X>=Y then X
        else Y end )
end

Max = proc {$ X Y R}$
  if X>=Y then R = X
  else R = Y end
end
andthen and orelse

\[(\text{expr}_1 \text{ andthen } \text{expr}_2)\]  
\[
\text{if } (\text{expr}_1 \text{ then } (\text{expr}_2 \text{ end})
\]

\[
(\text{expr}_1 \text{ orelse } \text{expr}_2)
\]

\[
\text{if } (\text{expr}_1 \text{ then true \ else } (\text{expr}_2 \text{ end})
\]
Function calls

Observe

\[ \{F1 \{F2 \, X\} \{F3 \, Y\}\} \]

local R1 R2 in
\{F2 \, X\, R1\}
\{F3 \, Y\, R2\}
\{F1 \, R1\, R2\}
end

The arguments of a function are evaluated first from left to right
A complete example

fun {Map Xs F}
  case Xs
  of nil then nil
  []  X|Xr then {F X}|{Map Xr F}
  end
end

proc {Map Xs F Ys}
  case Xs
  of nil then Ys = nil
  []  X|Xr then Y Yr in
       Ys = Y|Yr
       {F X Y}
       {Map Xr F Yr}
  end
end
Exceptions

How to handle exceptional situations in the program?

Examples:
  - divide by 0
  - opening a nonexistent file

Some errors are programming errors

Some errors are imposed by the external environment

Exception handling statements allow programs to handle and recover from errors
Exceptions

• The error confinement principle:
  – Define your program as a structured layers of components
  – Errors are visible only internally and a recovery procedure corrects the errors: either errors are not visible at the component boundary or are reported (nicely) to a higher level

• In one operation, exit from arbitrary depth of nested contexts
  – Essential for program structuring; else programs get complicated (use boolean variables everywhere, etc.)
Basic concepts

• A program that encounters an error (exception) should transfer execution to another part, the exception handler and give it a (partial) value that describes the error
• \texttt{try} ⟨s⟩_1 \texttt{catch} ⟨x⟩ \texttt{then} ⟨s⟩_2 \texttt{end}
• \texttt{raise} ⟨x⟩ \texttt{end}
• Introduce an exception marker on the semantic stack
• The execution is equivalent to ⟨s⟩_1 if it executes without raising an error
• Otherwise, ⟨s⟩_1 is aborted and the stack is popped up to the marker, the error value is transferred through ⟨x⟩, and ⟨s⟩_2 is executed
Exceptions (Example)

fun {Eval E}
    if {IsNumber E} then E
    else
case E
    of plus(X Y) then {Eval X}+{Eval Y}
    [] times(X Y) then {Eval X}*{Eval Y}
    else raise illFormedExpression(E) end
end
end
Exceptions (Example)

try
{Browse {Eval plus(5 6) }}
{Browse {Eval plus(times(5 5) 6) }}
{Browse {Eval plus(minus(5 5) 6) }}
catch illFormedExpression(E) then
{System.showInfo "**** illegal expresion ****" # E}
end
Try semantics

- The semantic statement is
  \((\text{try } \langle s \rangle_1 \text{ catch } \langle y \rangle \text{ then } \langle s \rangle_2 \text{ end, } E)\)
- Push the semantic statement \((\text{catch } \langle y \rangle \text{ then } \langle s \rangle_2 \text{ end, } E)\)
on on \(ST\)
- Push \((\langle s \rangle_1 , E)\) on \(ST\)
- Continue to next execution step
Raise semantics

- The semantic statement is
  \[(\text{raise } \langle x \rangle \text{ end, } E)\]
- Pop elements off \(ST\) looking for a \textit{catch} statement:
  - If a \textit{catch} statement is found, pop it from the stack
  - If the stack is emptied and no \textit{catch} is found, then stop execution
    with the error message ”Uncaught exception”
- Let \((\text{catch } \langle y \rangle \text{ then } \langle s \rangle \text{ end, } E_c)\) be the \textit{catch} statement that is found
- Push \((\langle s \rangle , E_c + \{<y> \rightarrow E(<x)>\})\) on \(ST\)
- Continue to next execution step
Catch semantics

- The semantic statement is 
  \((\text{catch } \langle x \rangle \text{ then } \langle s \rangle \text{ end, } E)\)
- Continue to next execution step (like \text{skip})
Full exception syntax

- Exception statements (expressions) with multiple patterns and `finally` clause

- Example:

```plaintext
FH = {OpenFile "xxxxx"}
try
  {ProcessFile FH}
catch X then
  {System.showInfo "***** Exception when processing *****" # X}
finally {CloseFile FH} end
```
finally syntax

```
try ⟨s⟩₁ finally ⟨s⟩₂ end
```

is converted to:

```
try ⟨s⟩₁
catch X then
  ⟨s⟩₂
  raise X end
end
⟨s⟩₂
```
Case statement revisited

- The semantic statement is
  \[
  \text{( case } \langle x \rangle \text{ of } \langle l \rangle \langle f_1 \rangle : \langle x_1 \rangle \ldots \langle f_n \rangle : \langle x_n \rangle \rangle \\
  \quad \text{then } \langle s_1 \rangle \\
  \quad \text{else } \langle s_2 \rangle \text{ end } , E)
  \]

- If the activation condition \( E(\langle x \rangle) \) is determined) is true:
  - If \( E(\langle x \rangle) \) is a record, the label of \( E(\langle x \rangle) \) is \( \langle l \rangle \) and its arity is \([\langle f_1 \rangle \ldots \langle f_n \rangle]\):
    push \((\text{try local } \langle x_1 \rangle = \langle x \rangle. \langle f_1 \rangle \ldots \langle x_n \rangle = \langle x \rangle. \langle f_n \rangle \text{ in } \langle s_1 \rangle^* \text{ end}
      \text{catch user(E) then raise E end } \text{[ E then } \langle s_2 \rangle \text{ end, E)}
    \text{on the stack, where } \langle s_1 \rangle^* \text{ is the same as } \langle s_1 \rangle \text{ except}
    \text{raise E end is changed to raise user(E) end}
  - Otherwise, push \((\langle s_2 \rangle, E)\) on the stack

- If the activation condition \( E(\langle x \rangle) \) is determined) is false:
  - Suspend
Exercises

49. VRH Exercise 2.9.3 (page 107).

50. VRH Exercise 2.9.7 (page 108) – translate example to kernel language and execute using operational semantics.

51. Write an example of a program that suspends. Now, write an example of a program that never terminates. Use the operational semantics to prove suspension or non-termination.

52. VRH Exercise 2.9.12 (page 110).

53. Change the semantics of the case statement, so that patterns can contain variable labels and variable feature names.
54. Restrict the kernel language to make it strictly functional (i.e., without dataflow variables)
   – Language similar to Scheme (dynamically typed functional language)
   
   This is done by disallowing variable declaration (without initialization) and disallowing procedural syntax
   – Only use implicit variable initialization
   – Only use functions
