3D IFS in OpenGL

Assignment 0: OpenGL Warmup

- Get familiar with:
  - C++ environment
  - OpenGL
  - Transformations
  - simple Vector & Matrix classes
  - CMake
- Have Fun!
- Due ASAP…

Today

- Surface Definitions
- Simple Data Structures
- Fixed Storage Data Structures
- Fixed Computation Data Structures
- Mesh Simplification

Today

- Surface Definitions
  - Well-Formed Surfaces
  - Orientable Surfaces
  - Computational Complexity
- Simple Data Structures
- Fixed Storage Data Structures
- Fixed Computation Data Structures
- Mesh Simplification
Well-Formed Surfaces

- Components Intersect "Properly"
  - Any pair of Faces are: disjoint, share single Vertex, or share 2 Vertices and the Edge joining them
  - Every edge is incident to exactly 2 vertices
  - Every edge is incident to exactly 2 faces
- Local Topology is "Proper"
  - Neighborhood of a vertex is homeomorphic to a disk (permits stretching and bending, but not tearing)
  - Also called a 2-manifold
  - If boundaries are allowed, points on the boundary are homeomorphic to a half-disk, called a "manifold with boundaries"
- Global Topology is "Proper"
  - Connected, Closed, & Bounded

Orientable Surfaces?

Questions?

Today

- Surface Definitions
  - Simple Data Structures
    - List of Polygons
    - List of Edges
    - List of Unique Vertices & Indexed Faces:
      - Simple Adjacency Data Structure
  - Fixed Storage Data Structures
  - Fixed Computation Data Structures
  - Mesh Simplification

Closed Surfaces and Refraction

- Original Teapot model is not "watertight": intersecting surfaces at spout & handle, no bottom, a hole at the spout tip, a gap between lid & base
- Requires repair before ray tracing with refraction

Computational Complexity

- Adjacent Element Access Time
  - linear, constant time average case, or constant time?
  - requires loops/recursion/if?
- Memory
  - variable size arrays or constant size?
- Maintenance
  - ease of editing
  - ensuring consistency

Henrik Wann Jensen
List of Polygons:

(3, -2, 5), (3, 6, 3), (-6, 2, 4)
(2, 2, 4), (0, -1, -2), (9, 4, 0), (4, 2, 9)
(1, 2, -2), (8, 8, 7), (-4, -5, 1)
(-8, 2, 7), (-2, 3, 9), (1, 2, -7)

List of Edges:

(3, 6, 2), (-6, 2, 4)
(2, 2, 4), (0, -1, -2)
(9, 4, 0), (4, 2, 9)
(8, 8, 7), (-4, -5, 1)
(-8, 2, 7), (1, 2, -7)
(3, 0, -3), (-7, 4, -3)
(9, 4, 0), (4, 2, 9)
(3, 6, 2), (-6, 2, 4)
(-3, 0, -4), (7, -3, -4)

List of Unique Vertices & Indexed Faces:

Vertices: (-1, -1, -1)
(-1, -1, 1)
(-1, 1, -1)
(-1, 1, 1)
(1, -1, -1)
(1, -1, 1)
(1, 1, -1)
(1, 1, 1)

Faces: 1 2 4 3
5 7 8 6
1 5 6 2
3 4 8 7
1 3 7 5
2 6 8 4

Problems with Simple Data Structures

• No Adjacency Information
• Linear-time Searches

Mesh Data

• So, in addition to:
  – Geometric Information (position)
  – Attribute Information (color, texture, temperature, population density, etc.)
• Let’s store:
  – Topological Information (adjacency, connectivity)

Simple Adjacency

• Each element (vertex, edge, and face) has a list of pointers to all incident elements
• Queries depend only on local complexity of mesh
• Data structures do not have fixed size
• Slow! Big! Too much work to maintain!
Questions?

Today

• Surface Definitions
• Simple Data Structures
• Fixed Storage Data Structures
  – Winged Edge (Baumgart, 1975)
• Fixed Computation Data Structures
• Mesh Simplification

Winged Edge (Baumgart, 1975)

• Each edge stores pointers to 4 Adjacent Edges, 2 Face & 2 Vertex neighbors
• Vertices and Faces have a single pointer to one incident Edge
• Data Structure Size?
  Fixed
• How do we gather all faces surrounding one vertex?
  Messy, because there is no consistent way to order pointers

HalfEdge (Eastman, 1982)

• Every edge is represented by two directed HalfEdge structures
• Each HalfEdge stores:
  – vertex at end of directed edge
  – symmetric half edge
  – face to left of edge
  – next points to the HalfEdge counter-clockwise around face on left
• Orientation is essential, but can be done consistently!

HalfEdge (Eastman, 1982)

• Starting at a half edge, how do we find:
  the other vertex of the edge?
  the other face of the edge?
  the clockwise edge around the face at the left?
  all the edges surrounding the face at the left?
  all the faces surrounding the vertex?
**HalfEdge (Eastman, 1982)**

- Loop around a Face:
  ```
  HalfEdgeMesh::FaceLoop(HalfEdge *HE) {
    HalfEdge *loop = HE;
    do {
      loop = loop->Next;
    } while (loop != HE);
  }
  ```

- Loop around a Vertex:
  ```
  HalfEdgeMesh::VertexLoop(HalfEdge *HE) {
    HalfEdge *loop = HE;
    do {
      loop = loop->Next->Sym;
    } while (loop != HE);
  }
  ```

**HalfEdge (Eastman, 1982)**

- Data Structure Size?
  - Fixed

- Data:
  - geometric information stored at Vertices
  - attribute information in Vertices, HalfEdges, and/or Faces
  - topological information in HalfEdges only!

- Orientable surfaces only (no Mobius Strips!)

- Local consistency everywhere implies global consistency

- Time Complexity?
  - linear in the amount of information gathered

**SplitEdge Data Structure:**

- HalfEdge and SplitEdge are dual structures!

  ```
  SplitEdgeMesh::FaceLoop() = HalfEdgeMesh::VertexLoop();
  SplitEdgeMesh::VertexLoop() = HalfEdgeMesh::FaceLoop();
  ```

**Corner Data Structure:**

- The Corner data structure is its own dual!

**Questions?**

**Today**

- Surface Definitions
- Simple Data Structures
- Fixed Storage Data Structures
- Fixed Computation Data Structures
  - HalfEdge (Eastman, 1982)
  - SplitEdge
  - Corner
  - QuadEdge (Guibas and Stolfi, 1985)
  - FacetEdge (Dobkin and Laszlo, 1987)
- Mesh Simplification
QuadEdge (Guibas and Stolfi, 1985)

- Consider the Mesh and its Dual simultaneously
  - Vertices and Faces switch roles, we just re-label them
  - Edges remain Edges
- Now there are eight ways to look at each edge
  - Four ways to look at primal edge
  - Four ways to look at dual edge

QuadEdge (Guibas and Stolfi, 1985)

- Relations Between Edges: Edge Algebra
- Elements in Edge Algebra:
  - Each of 8 ways to look at each edge
- Operators in Edge Algebra:
  - Rot: Bug rotates 90 degrees to its left (switches to/from dual graph)
  - Sym: Bug turns around 180 degrees
  - Flip: Bug flips up-side down
  - Onext: Bug rotates CCW to next edge with same origin (either Vertex or Face)

QuadEdge (Guibas and Stolfi, 1985)

- Some Properties of Flip, Sym, Rot, and Onext:
  - \( e \text{ Rot}^4 = e \)
  - \( e \text{ Rot}^2 \neq e \)
  - \( e \text{ Flip} = e \)
  - \( e \text{ Flip} \text{ Rot} \text{ Flip} \text{ Rot} = e \)
  - \( e \text{ Rot} \text{ Flip} \text{ Rot} \text{ Flip} = e \)
  - \( e \text{ Rot} \text{ Onext} \text{ Rot} \text{ Onext} = e \)
  - \( e \text{ Flip} \text{ Onext} \text{ Flip} \text{ Onext} = e \)
  - \( e \text{ Flip} = e \text{ Flip} \)
  - \( e \text{ Sym} = e \text{ Rot} \)
  - \( e \text{ Rot}^3 = e \)
  - \( e \text{ Rot}^3 = e \text{ Flip} \text{ Rot} \text{ Flip} \)
  - \( e \text{ Onext}^4 = e \text{ Rot} \text{ Onext} \text{ Rot} \)
  - \( e \text{ Onext}^4 = e \text{ Flip} \text{ Onext} \text{ Flip} \)

QuadEdge (Guibas and Stolfi, 1985)

- Other Useful Definitions:
  - \( e \text{ Lnext} = e \text{ Rot}^{-1} \text{ Onext} \text{ Rot} \)
  - \( e \text{ Rnext} = e \text{ Rot} \text{ Onext} \text{ Rot}^{-1} \)
  - \( e \text{ Dnext} = e \text{ Sym} \text{ Onext} \text{ Sym}^{-1} \)
  - \( e \text{ Oprev} = e \text{ Onext}^{-1} = e \text{ Rot} \text{ Onext} \text{ Rot} \)
  - \( e \text{ Lprev} = e \text{ Lnext}^{-1} = e \text{ Onext} \text{ Sym} \)
  - \( e \text{ Rprev} = e \text{ Rnext}^{-1} = e \text{ Sym} \text{ Onext} \)
  - \( e \text{ Dprev} = e \text{ Dnext}^{-1} = e \text{ Rot}^{-1} \text{ Onext} \text{ Rot} \)
- All of these functions can be expressed as a constant number of Rot, Sym, Flip, and Onext operations independent of the local topology and the global size and complexity of the mesh.

FacetEdge (Dobkin and Laszlo, 1987)

- QuadEdge (2D, surface) \(\rightarrow\) FacetEdge (3D, volume)
- Faces \(\rightarrow\) Polyhedra / Cells
- Edge \(\rightarrow\) Polygon & Edge pair

- Mesh Simplification

Hugues Hoppe “Progressive Meshes” SIGGRAPH 1996

Progressive Meshes

- Mesh Simplification
  - vertex split / edge collapse
  - geometry & discrete/scalar attributes
  - priority queue
- Level of Detail
  - geomorphs
- Progressive Transmission
- Mesh Compression
- Selective Refinement
  - view dependent

Selective Refinement

Figure 10: Selective refinement of a terrain mesh taking into account view frustum, silhouette regions, and projected screen size of faces (7,438 faces).

Preserving Discontinuity Curves

Other Simplification Strategies

- Remove a vertex & surrounding triangles, re-triangulate the hole

- Merge Nearby Vertices
  - will likely change the topology…

When to Preserve Topology?

Quadric Error Simplification

- Contract (merge) vertices $v_i$ and $v_j$ if:
  - $(v_i, v_j)$ is an edge, or
  - $||v_i - v_j|| < t$, where $t$ is a threshold parameter
- Track cumulative error by summing 4x4 quadric error matrices after each operation:

\[
\Delta_e = \sum_{p \in \mathcal{P}} (p' \cdot p'')^2
\]

\[
= \sum_{p \in \mathcal{P}} v_i \cdot v_j
\]

\[
= v_i \left( \sum_{p \in \mathcal{P}} k_{ij} \right)
\]

Judging Element Quality

- How “equilateral” are the elements?
- For Triangles:
  - Ratio of shortest to longest edge
  - Ratio of area to perimeter
  - Smallest angle
  - Ratio of area to area of smallest circumscribed circle
- For Tetrahedra:
  - Ratio of volume to surface area
  - Smallest solid angle
  - Ratio of volume to volume of smallest circumscribed sphere

Readings for Tuesday (pick one)

- "Teddy: A Sketching Interface for 3D Freeform Design”, Igarashi et al., SIGGRAPH 1999
- Post a comment or question on the LMS discussion by 10am on Tuesday
