Monte Carlo Ray Tracing

- Cast a ray from the eye through each pixel
- Cast random rays to accumulate radiance contribution
 - Recurse to solve the Rendering Equation

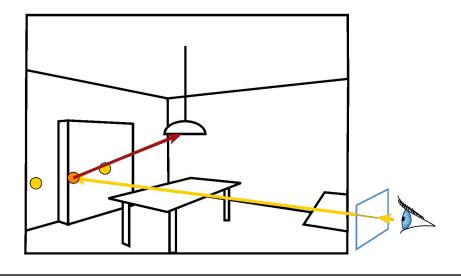

Irradiance Cache

- The indirect illumination is smooth
- Store the indirect illumination

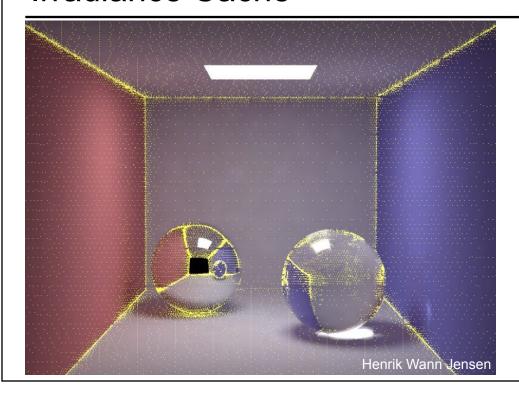

Irradiance Cache

- Interpolate nearby cached values
- But do full calculation for direct lighting

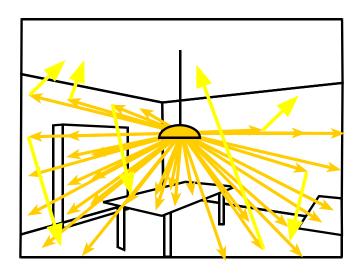

Irradiance Cache

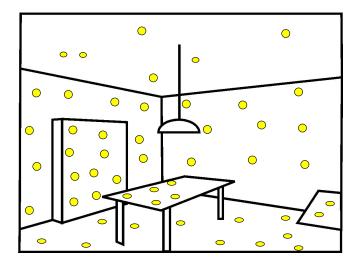

Photon Mapping

- Preprocess: cast rays from light sources
 - independent of viewpoint

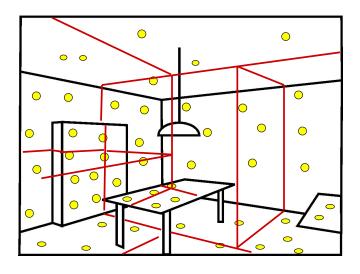

Photon Mapping

- Store photons
 - position + light power + incoming direction

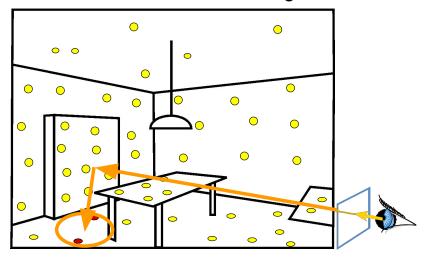

Storing the Photon Map

- Efficiently store photons for fast access
- Use hierarchical spatial structure (kd-tree)

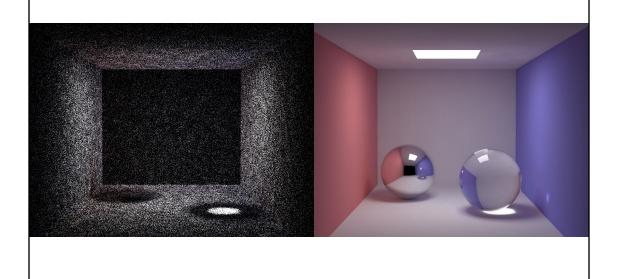

Rendering with Photon Map

- Cast primary rays
- For secondary rays: reconstruct irradiance using k closest photons
- Combine with irradiance caching and other techniques

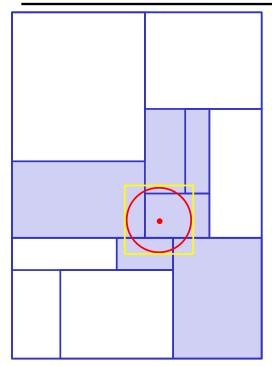

Photon Map Results

- Find the tightest sphere that captures k photons
 - NOTE: HW3 code gives you all photons that *might* be in the query bounding box (you need to test for exact box and/or exact sphere)
- Divide the energy from those photons by the surface area covered by that sphere
- What about thin surfaces, concave corners,
 & convex corners?

Photons in the k-d tree details

- You start with a query point & radius (red circle)
- KDTree::CollectPhotonsInBox
 - Input: a bounding box (yellow)
 - Finds all k-d tree cells (blue) that overlap with the bounding box
 - Returns all photons in those cells
- You must discard all photons not in your original query radius
- Should it return only return the photons in the yellow box? Why not?

Monte-Carlo Computation of π

- Take a random point (x,y) in unit square
- Test if it is inside the 1/4 disc
 - $\text{ Is } x^2 + y^2 < 1?$
- Probability of being inside disc?
 - area of ¼ unit circle / area of unit square
 π /4

 $16/21 = 0.7619 \approx \pi / 4 = 0.7854$ $\pi \approx 3.1416$

- $\pi \approx 4$ * number inside disc / total number
- The error depends on the number of trials

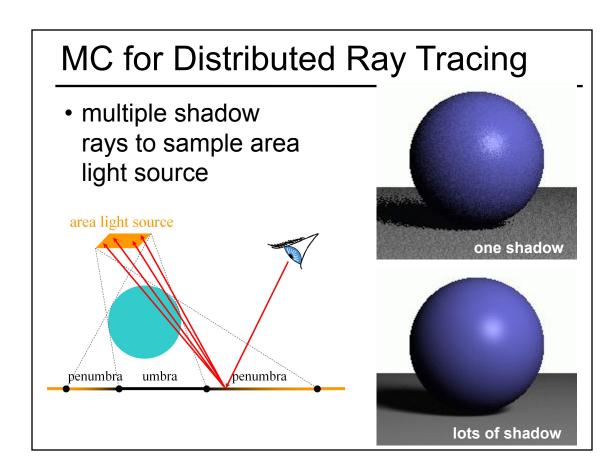

Use MC to calculate Form Factor

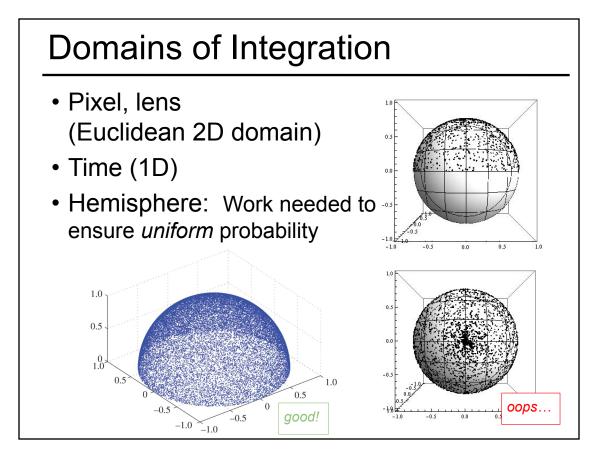

- Cast n rays between the two patches
 - Compute visibility (what fraction of rays do not hit an occluder)
 - Integrate the point-to-point form factor

Use this for HW3!

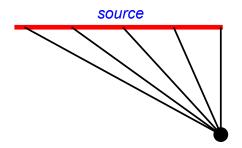

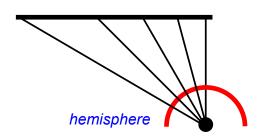

Example: Light Source

- We can integrate over surface or over angle
- But we must be careful to get probabilities and integration measure right!
 - It might require re-weighting/normalizing samples

Sampling the source uniformly

Sampling the hemisphere uniformly

Convergence & Error

- Let's "compute 0.5" by flipping a coin:
 - 1 flip: 0 or 1
 - \rightarrow average error = 0.5
 - 2 flips: 0, 0.5, 0.5 or 1
 - \rightarrow average error = 0. 25
 - 4 flips: 0 (*1),0.25 (*4), 0.5 (*6), 0.75(*4), 1(*1)
 - \rightarrow average error = 0.1875
- Unfortunately, doubling the number of samples does not double accuracy

Monte Carlo Integration

- Turn integral into finite sum
- Use n random samples
- As n increases...
 - Expected value remains the same
 - Variance decreases by n
 - Standard deviation (error) decreases by $\frac{1}{\sqrt{n}}$
- Thus, converges with $\frac{1}{\sqrt{n}}$

Advantages of MC Integration

- Few restrictions on the integrand
 - Doesn't need to be continuous, smooth, ...
 - Only need to be able to evaluate at a point
- Extends to high-dimensional problems
 - Same convergence
- · Conceptually straightforward
- Efficient for solving at just a few points

Disadvantages of MC Integration

- Noisy
- Slow convergence
- Good implementation is hard
 - Debugging code
 - Debugging math
 - Choosing appropriate techniques
- Punctual technique, no notion of smoothness of function (e.g., between neighboring pixels)

Stratified Sampling

- With uniform sampling, we can get unlucky
 - E.g. all samples in a corner

- Each region is called a stratum
- Take one random samples per Ω_i

Stratified Sampling Example

 $O(1/\sqrt{N})$ O(1/N)

Unstratified

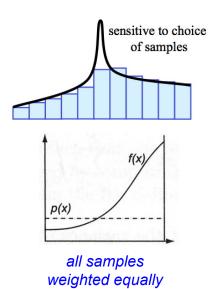

Slide from Henrik Wann Jensen

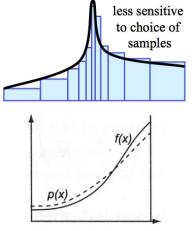

Stratified

Sampling Options

uniform sampling (or uniform random)

dense sampling where function has greater magnitude

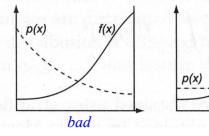

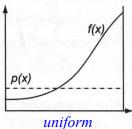

weights (width) for dense samples are reduced

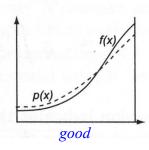

Importance Sampling

$$\langle I \rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{f(x_i)}{p(x_i)}$$

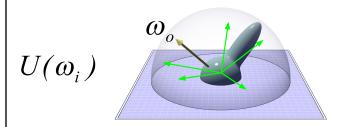

- Choose p wisely to reduce variance
 - Want to use a p that resembles f
 - Does not change convergence rate (still sqrt)
 - But decreases the constant

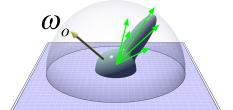

Uniform vs. Importance Sampling

What is a Pixel?

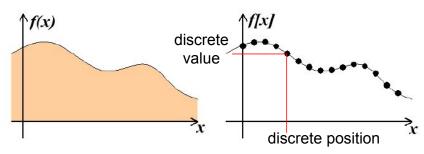

- A pixel is not:
 - a box
 - a disk
 - a teeny tiny little light
- A pixel "looks different" on different display devices
- · A pixel is a sample
 - it has no dimension
 - it occupies no area
 - it cannot be seen
 - it has a coordinate
 - it has a value

How & What do we Sample?

- Most things in the real world are *continuous*, yet everything in a computer is *discrete*
- The process of mapping a continuous function to a discrete one is called sampling
- The process of mapping a continuous variable to a discrete one is called *quantization*
- To represent or render an image using a computer, we must both sample and quantize

An Image is a 2D Function

- An *ideal image* is a continuous function I(x,y) of intensities.
- It can be plotted as a height field.
- In general an image cannot be represented as a continuous, analytic function.
- Instead we represent images as tabulated functions.
- How do we fill this table?

Sampling Grid

 We can generate the table values by multiplying the continuous image function by a sampling grid of Kronecker delta functions.

The definition of the 2-D Kronecker delta is:

$$\delta(x,y) = \begin{cases} 1, & (x,y) = (0,0) \\ 0, & \text{otherwise} \end{cases}$$

And a 2-D sampling grid:

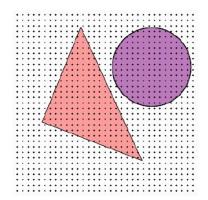

$$\sum_{j=0}^{h-1} \sum_{i=0}^{w-1} \delta(u-i, v-j)$$

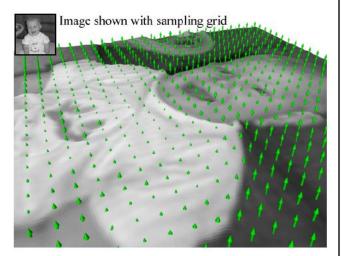

Sampling an Image

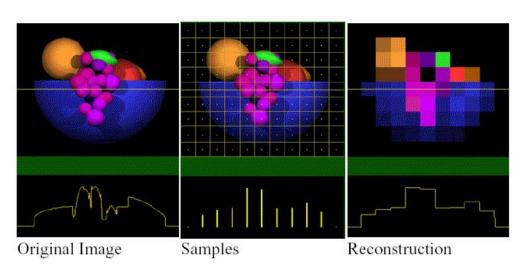

• The result is a set of point samples, or pixels.

The same analysis can be applied to geometric objects:

Examples of Aliasing

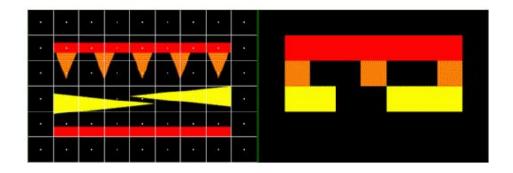

Aliasing occurs because of sampling and reconstruction

Jagged boundaries Victorial Control of Aliasing

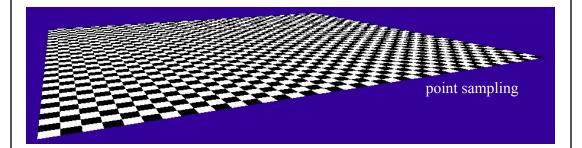

Examples of Aliasing

Sampling Density

 If we insufficiently sample the signal, it may be mistaken for something simpler during reconstruction (that's aliasing!)

Distributed Ray Tracing",
An Introduction to Ray Tracing,
Andrew Glassner, ed.,
Academic Press Limited, 1989.

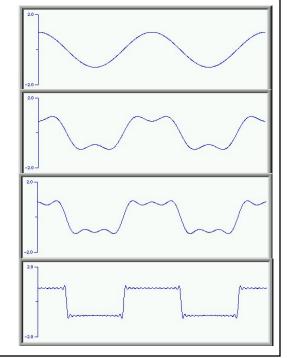

Sampling Density

 Aliasing in 2D because of insufficient sampling density

Signals & Systems

 All periodic signals can be represented as a summation of sinusoidal waves.

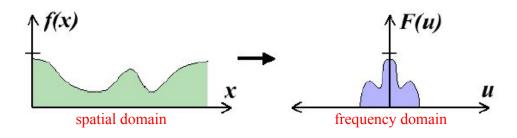

It's a shame that Signals & Systems is not required for CSCI majors...

Images from http://axion.physics.ubc.ca/341-02/fourier/fourier.html

Frequency Analysis

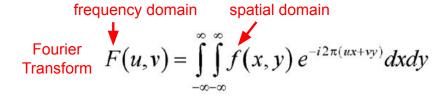

• Every periodic signal in the *spatial domain* has a dual in the *frequency domain*.

 This particular signal is band-limited, meaning it has no frequencies above some threshold

Fourier Transform

 We can transform from one domain to the other using the Fourier Transform.

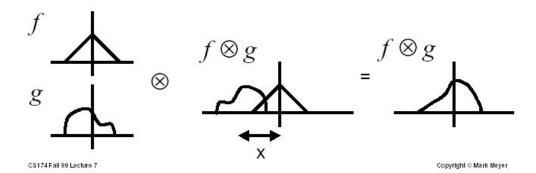

Inverse Fourier Transform
$$f(x,y) = \int_{-\infty-\infty}^{\infty} \int_{-\infty}^{\infty} F(u,v) e^{-i2\pi(ux+vy)} du dv$$

Convolution

Convolution describes how a system with impulse response, h(x), reacts to a signal, f(x).

$$f(x) * h(x) = \int_{-\infty}^{\infty} f(\lambda)h(x - \lambda)d\lambda$$

Images from Mark Meyer http://www.gg.caltech.edu/~cs174ta/

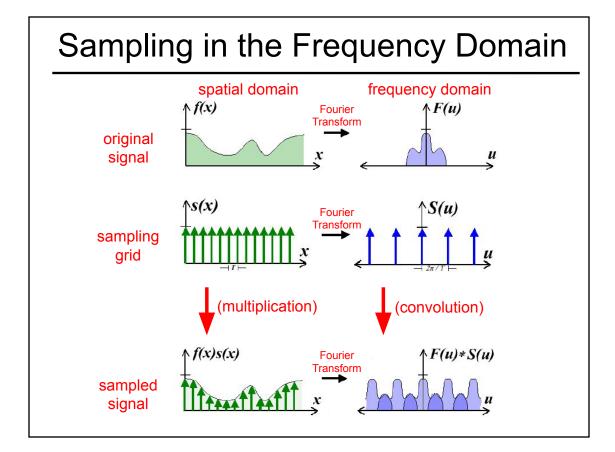

Fourier Transform & Convolution

- Some operations that are difficult to compute in the spatial domain can be simplified by transforming to its dual representation in the frequency domain.
- For example, convolution in the spatial domain is the same as multiplication in the frequency domain.

$$f(x) * h(x) \rightarrow F(u)H(u)$$

 And, convolution in the frequency domain is the same as multiplication in the spatial domain

$$F(u)*H(u) \rightarrow f(x)h(x)$$

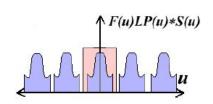

Reconstruction

 If we can extract a copy of the original signal from the frequency domain of the sampled signal, we can reconstruct the original signal!

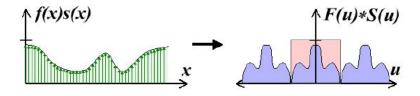

• But there may be overlap between the copies.

Guaranteeing Proper Reconstruction

 Separate by removing high frequencies from the original signal (low pass pre-filtering)

Separate by increasing the sampling density

 If we can't separate the copies, we will have overlapping frequency spectrum during reconstruction → aliasing.

Sampling Theorem

 When sampling a signal at discrete intervals, the sampling frequency must be greater than twice the highest frequency of the input signal in order to be able to reconstruct the original perfectly from the sampled version (Shannon, Nyquist)

- Papers for Tuesday

Filters

- Weighting function (convolution kernel)
- · Area of influence often bigger than "pixel"
- Sum of weights = 1
 - Each sample contributes the same total to image
 - Constant brightness as object moves across the screen.
- No negative weights/colors (optional)

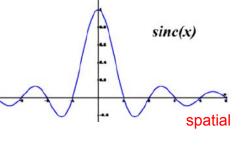

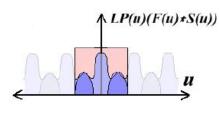

Filters

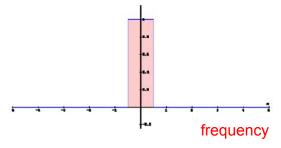

- Filters are used to
 - reconstruct a continuous signal from a sampled signal (reconstruction filters)
 - band-limit continuous signals to avoid aliasing during sampling (low-pass filters)
- Desired frequency domain properties are the same for both types of filters
- Often, the same filters are used as reconstruction and low-pass filters

The Ideal Filter

- Unfortunately it has infinite spatial extent
 - Every sample contributes to every interpolated point
- Expensive/impossible to compute

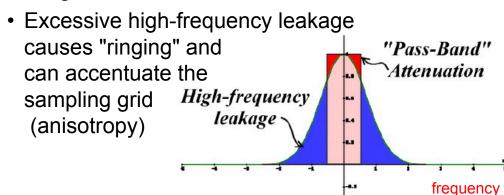

Problems with Practical Filters

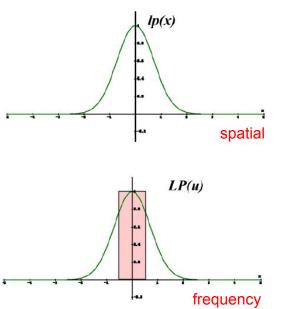

- Many visible artifacts in re-sampled images are caused by poor reconstruction filters
- Excessive pass-band attenuation results in blurry images

Gaussian Filter

This is what a CRT does for free!

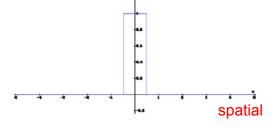

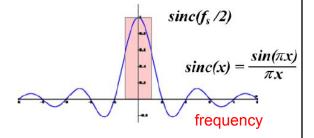

Box Filter / Nearest Neighbor

• Pretending pixels are little squares.

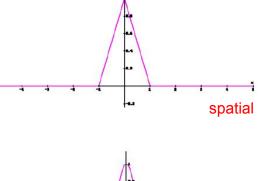

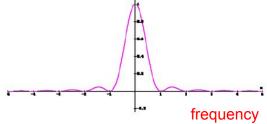

Tent Filter / Bi-Linear Interpolation

- Simple to implement
- Reasonably smooth

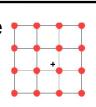

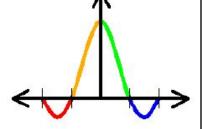

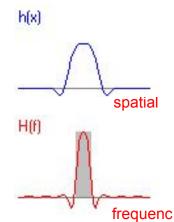

Bi-Cubic Interpolation

 Begins to approximate the ideal spatial filter, the sinc function

Sampling Texture Maps

 When texture mapping it is rare that the screen-space sampling density matches the sampling density of the texture.

64x64 pixels

Original Texture

Magnification for Display

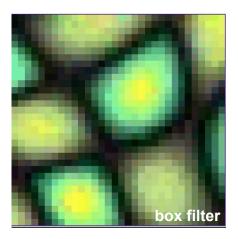

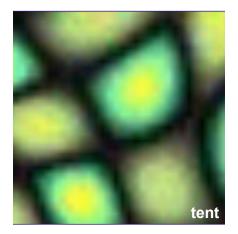

Minification for Display

for which we must use a reconstruction filter

Linear Interpolation

- Tell OpenGL to use a tent filter instead of a box filter.
- Magnification looks better, but blurry
 - (texture is under-sampled for this resolution)

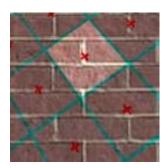

Spatial Filtering

- Remove the high frequencies which cause artifacts in texture minification.
- Compute a spatial integration over the extent of the pixel
- This is equivalent to convolving the texture with a filter kernel centered at the sample (i.e., pixel center)!
- Expensive to do during rasterization, but an approximation it can be precomputed

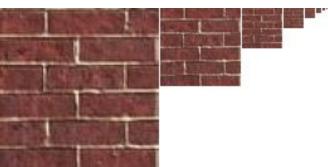

projected texture in image plane

box filter in texture plane

MIP Mapping

 Construct a pyramid of images that are pre-filtered and re-sampled at 1/2, 1/4, 1/8, etc., of the original image's sampling

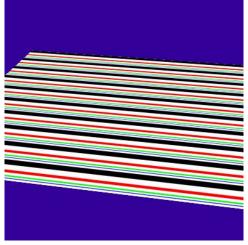

- During rasterization
 we compute the index of the decimated image that is
 sampled at a rate closest to the density of our desired
 sampling rate
- MIP stands for multum in parvo which means many in a small place

MIP Mapping Example

• Thin lines may become disconnected / disappear

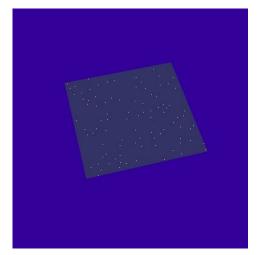

Nearest Neighbor

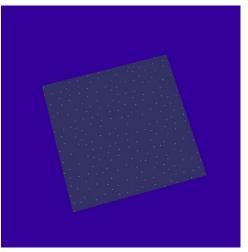

MIP Mapped (Bi-Linear)

MIP Mapping Example

Small details may "pop" in and out of view

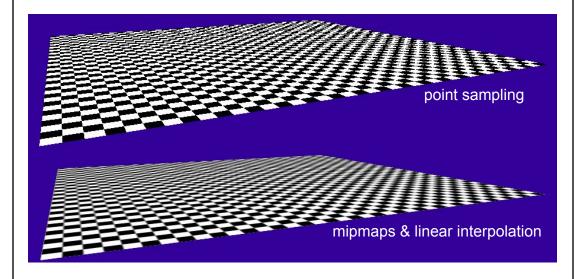

Nearest Neighbor

MIP Mapped (Bi-Linear)

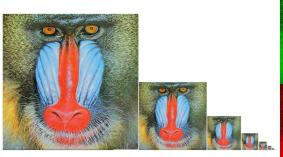

Examples of Aliasing

Texture Errors

Storing MIP Maps

- Can be stored compactly
- Illustrates the 1/3 overhead of maintaining the MIP map

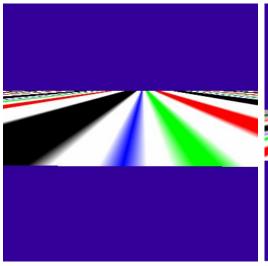

10-level mip map

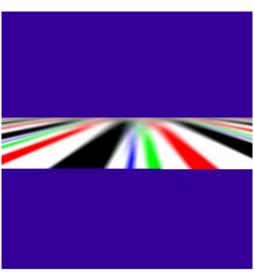

Memory format of a mip map

Anisotropic MIP-Mapping

What happens when the surface is tilted?

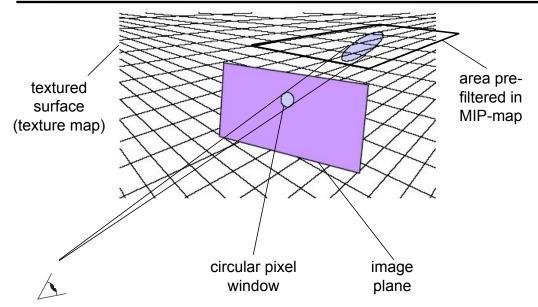

Nearest Neighbor

MIP Mapped (Bi-Linear)

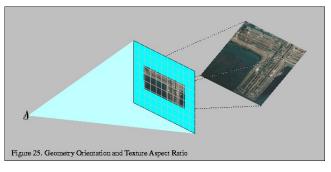

Anisotropic MIP-Mapping

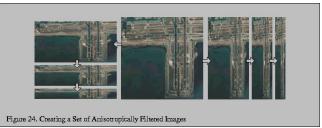

Square MIP-map area is a bad approximation

Anisotropic MIP-Mapping

- We can use different mipmaps for the 2 directions
- Additional extensions can handle non axis-aligned views
