Today

- Why are Shadows Important?
- Planar Shadows
- Projective Texture Shadows
- Shadow Maps
- Shadow Volumes

Why are Shadows Important?

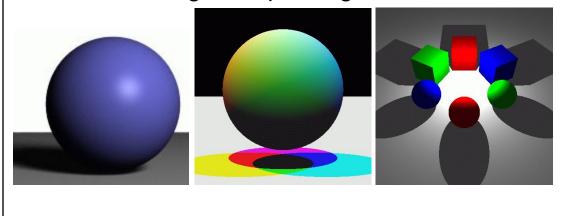

- Depth cue
- Scene Lighting
- Realism
- Contact points

Shadows as a Depth Cue

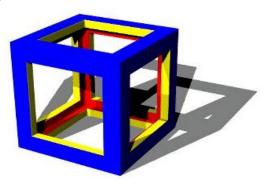

For Intuition about Scene Lighting

- Position of the light (e.g. sundial)
- Hard shadows vs. soft shadows
- Colored lights
- Directional light vs. point light

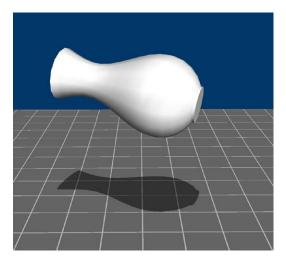

Today

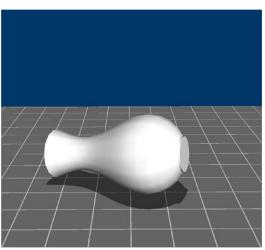

- Why are Shadows Important?
- Planar Shadows
- Projective Texture Shadows
 - Shadow View Duality
 - Texture Mapping
- Shadow Maps
- Shadow Volumes

Cast Shadows on Planar Surfaces

 Draw the object primitives a second time, projected to the ground plane

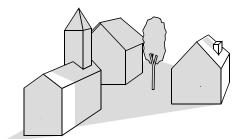

Limitations of Planar Shadows

 Does not produce self-shadows, shadows cast on other objects, shadows on curved surfaces, etc.

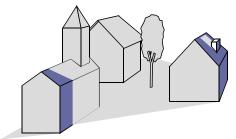

Shadow/View Duality

 A point is lit if it is visible from the light source

 Shadow computation similar to view computation

Texture Mapping

 Don't have to represent everything with geometry

Fake Shadows using Projective Textures

- Separate obstacle and receiver
- Compute b/w image of obstacle from light
- Use image as projective texture for each receiver

Image from light source

BW image of obstacle

Final image

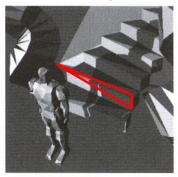

Figure from Moller & Haines "Real Time Rendering"

Projective Texture Shadow Limitations

- Must specify occluder & receiver
- No self-shadows
- Resolution

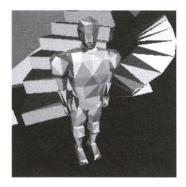

Figure from Moller & Haines "Real Time Rendering"

Questions?

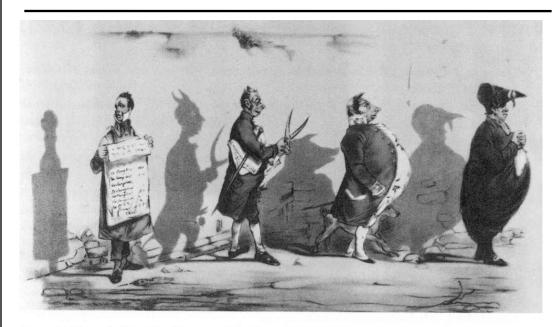

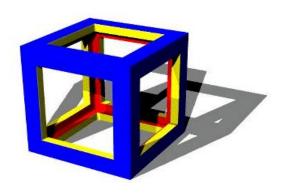

Plate 52 Grandville, The Shadows (The French Cabinet) from La Caricature, 1830.

Today

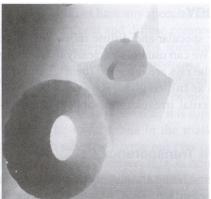

- Why are Shadows Important?
- Planar Shadows
- Projective Texture Shadows
- Shadow Maps
- Shadow Volumes

Shadow Maps

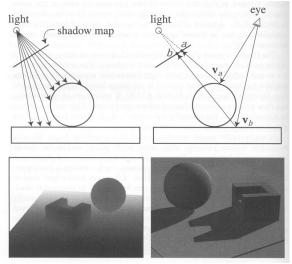

- In Renderman
 - (High-end production software)

Shadow Mapping

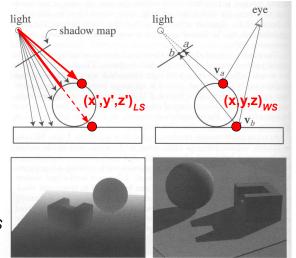

- Texture mapping with depth information
- Requires 2 passes through the pipeline:
 - Compute shadow map (depth from light source)
 - Render final image, check shadow map to see if points are in shadow

Foley et al. "Computer Graphics Principles and Practice"

Shadow Map Look Up

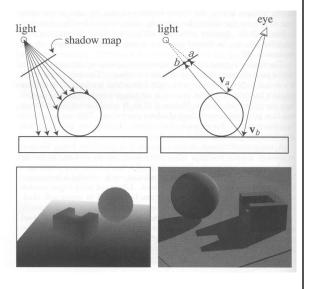

- We have a 3D point (x,y,z)_{WS}
- How do we look up the depth from the shadow map?
- Use the 4x4
 perspective projection
 matrix from the light
 source to get (x',y',z'), s
- ShadowMap(x',y') < z'?

Foley et al. "Computer Graphics Principles and Practice"

Limitations of Shadow Maps

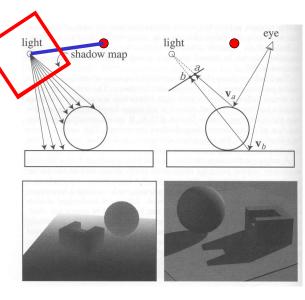

- Field of View
- 2. Bias (Epsilon)
- 3. Aliasing

1. Field of View Problem

 What if point to shadow is outside field of view of shadow map?

- Use cubical shadow map
- Use only spot lights!

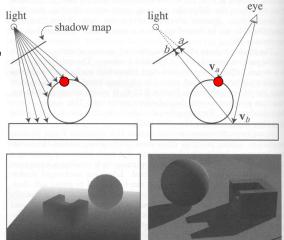

2. The Bias (Epsilon) Nightmare

 For a point visible from the light source

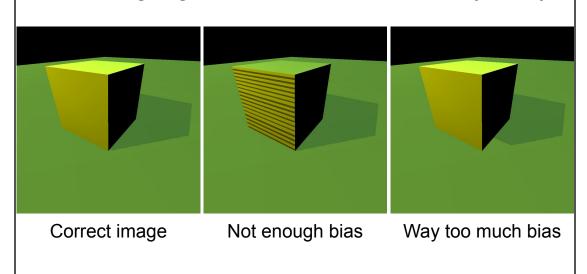

ShadowMap(x',y') $\approx z'$

- How can we avoid erroneous self-shadowing?
 - Add bias (epsilon)

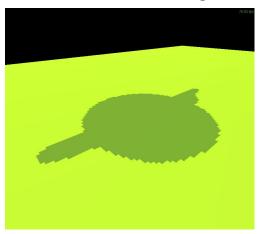

2. Bias (Epsilon) for Shadow Maps

ShadowMap(x',y') + bias < z'
Choosing a good bias value can be very tricky

3. Shadow Map Aliasing

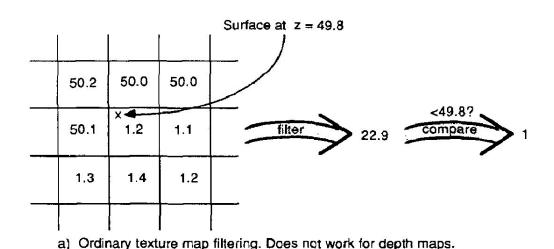

- Under-sampling of the shadow map
- Reprojection aliasing especially bad when the camera & light are opposite each other

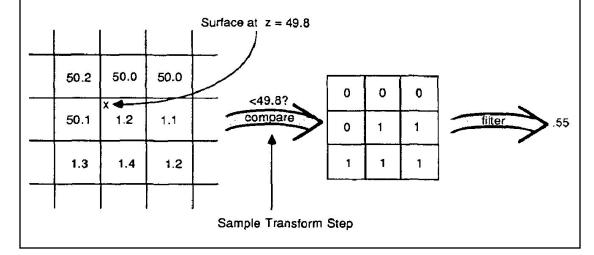

3. Shadow Map Filtering

- Should we filter the depth?
 (weighted average of neighboring depth values)
- · No... filtering depth is not meaningful

3. Percentage Closer Filtering

- Instead filter the result of the test (weighted average of comparison results)
- But makes the bias issue more tricky

3. Percentage Closer Filtering

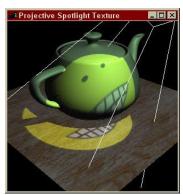

- 5x5 samples
- Nice antialiased shadow
- Using a bigger filter produces fake soft shadows
- Setting bias is tricky

Projective Texturing + Shadow Map

Light's View

Depth/Shadow Map

Eye's View

Shadows in Production

- Often use shadow maps
- Ray casting as fallback in case of robustness issues

Figure 12. Frame from Luxo Jr.

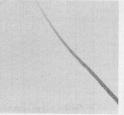

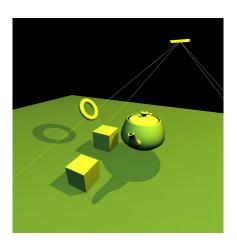

Figure 13. Shadow maps from Luxo Jr.

Hardware Shadow Maps

- Can be done with hardware texture mapping
 - Texture coordinates u,v,w generated using 4x4 matrix
 - Modern hardware permits tests on texture values

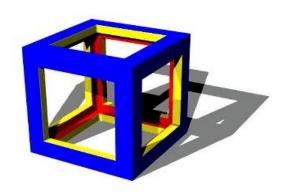

Questions?

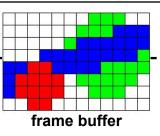

Today

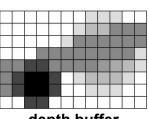

- Why are Shadows Important?
- Planar Shadows
- Projective Texture Shadows
- Shadow Maps
- Shadow Volumes
 - The Stencil Buffer

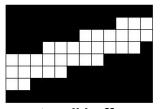

Stencil Buffer

- Tag pixels in one rendering pass to control their update in subsequent rendering passes
 - "For all pixels in the frame buffer" → "For all tagged pixels in the frame buffer"
- Can specify different rendering operations for each case:
 - stencil test fails
 - stencil test passes & depth test fails
 - stencil test passes & depth test passes

depth buffer

stencil buffer

Stencil Buffer - Real-time Mirror

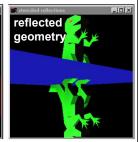

- · Clear frame, depth & stencil buffers
- Draw all non-mirror geometry to frame & depth buffers
- Draw mirror to stencil buffer, where depth buffer passes
- Set depth to infinity, where stencil buffer passes
- Draw reflected geometry to frame & depth buffer, where stencil buffer passes

also discusses blending, multiple mirrors, objects behind mirror, etc...

Shadow Volumes

 Explicitly represent the volume of space in shadow

For each polygon

Pyramid with point light as apex

- Include polygon to cap

Shadow test similar to clipping

Shadow Volumes

If a point is inside a shadow volume cast by a particular light, the point does not receive any illumination from that light
Cost of naive implementation:

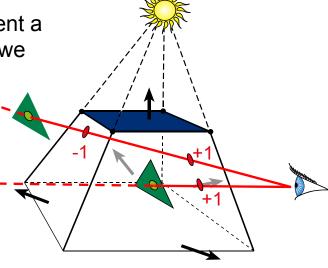

Shadow Volumes

#polygons * #lights

 Shoot a ray from the eye to the visible point

 Increment/decrement a counter each time we intersect a shadow volume polygon (check z buffer)

If the counter ≠ 0,
 the point is
 in shadow

Shadow Volumes w/ the Stencil Buffer

Initialize stencil buffer to 0

Draw scene with ambient light only

Turn off frame buffer & z-buffer updates

Draw front-facing shadow polygons

If z-pass → increment counter

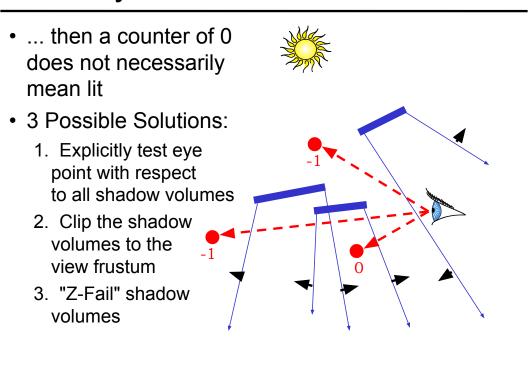

Draw back-facing shadow polygons

If z-pass → decrement counter

Turn on frame buffer updates

Turn on lighting and redraw pixels with counter = 0

If the Eye is in Shadow...

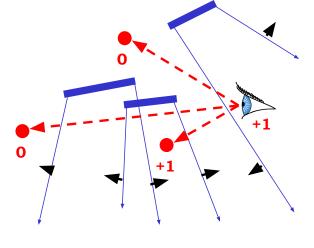

1. Test Eye with Respect to Volumes

Adjust initial counter value

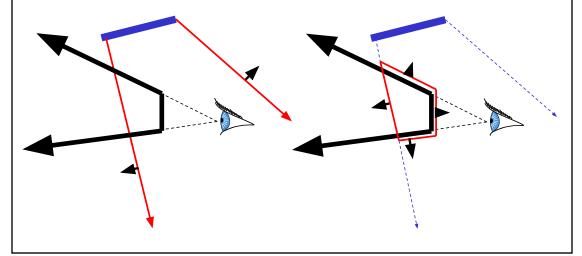

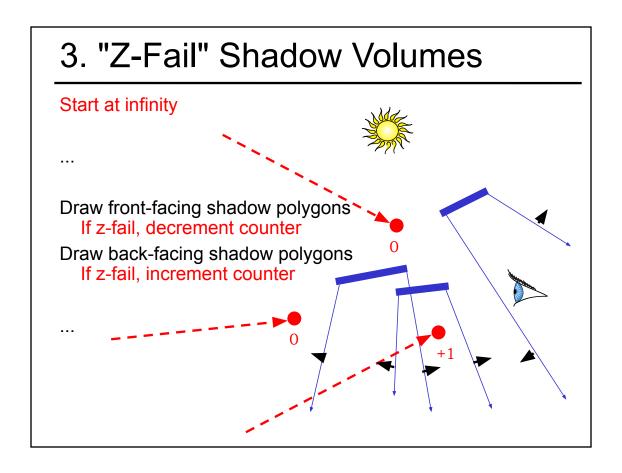

Expensive

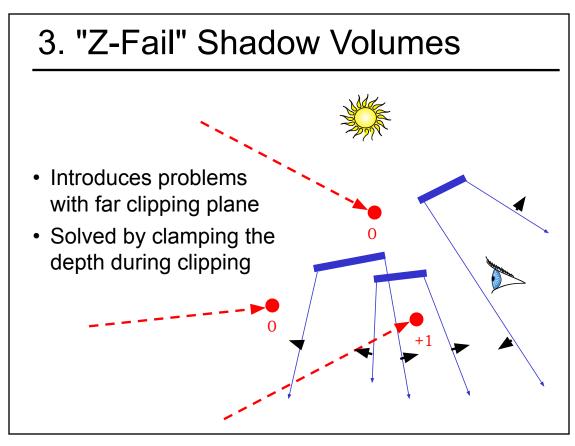

2. Clip the Shadow Volumes

- Clip the shadow volumes to the view frustum and include these new polygons
- Messy CSG

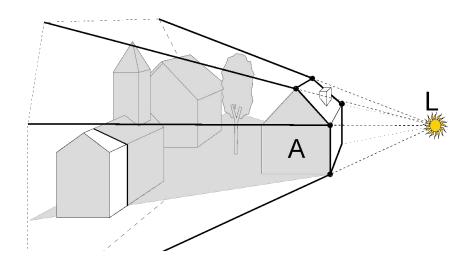

Optimizing Shadow Volumes

 Use silhouette edges only (edge where a back-facing & front-facing polygon meet)

Limitations of Shadow Volumes

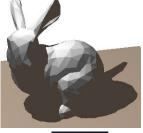

- Introduces a lot of new geometry
- Expensive to rasterize long skinny triangles
- Limited precision of stencil buffer (counters)
 - for a really complex scene/object,
 the counter can overflow
- Objects must be watertight to use silhouette trick
- Rasterization of polygons sharing an edge must not overlap & must not have gap

Homework 4

- Create some geometry
 - Reflected object & floor
 - Silhouette edges
 - Shadow polygons
 - Make sure your polygons aren't doubled up
 - Make sure your polygons are oriented consistently
- · Mess with the stencil buffer
 - Don't just blindly copy code from the tutorial
 - Use the web to read the man page for each instruction & its parameters

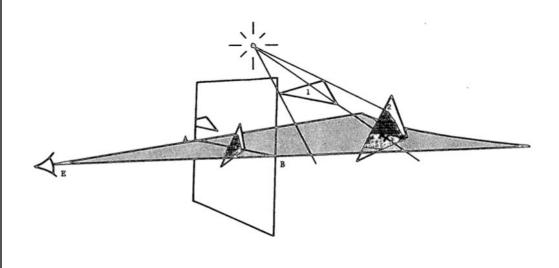

Hopefully everyone can get the examples to compile & run
