# Simulation and Experiments in Vibratory Manipulation: Rigid Bodies on a Vibrating Surface 

Tom Vose, Paul Umbanhowar, and Kevin M. Lynch<br>Laboratory for Intelligent Mechanical Systems<br>Mechanical Engineering Department<br>lims.mech.northwestern.edu<br>and<br>Northwestern Institute on Complex Systems (NICO) nico.northwestern.edu<br>Northwestern University<br>

hand controls ball: grasping
shared control: nonprehensile manipulation
environment controls ball

throwing and batting (U Tokyo)

pushing

Examples

bat juggling

pushing and toppling

dribbling (TU Munich)

vibratory feeding
rolling (Michael Moschen)

rolling on a constraint surface (dung beetle, Natl Geo)

## Why Nonprehensile Manipulation?

## Why Nonprehensile Manipulation?

- Given a robot, increase the set of solvable tasks
- Given a task, use cheaper, simpler robots (automation)
- Most manipulation is nonprehensile! (pushing, throwing, tapping, sliding, rolling, batting, kicking, ...)

## Why Nonprehensile Manipulation?

- Given a robot, increase the set of solvable tasks
- Given a task, use cheaper, simpler robots (automation)
- Most manipulation is nonprehensile! (pushing, throwing, tapping, sliding, rolling, batting, kicking, ...)

## Research Topics

- sensing/observability/uncertainty
- mechanics and modeling
- motion planning
- feedback control
- understanding what tasks are solvable (e.g., accessibility, controllability)

## Outline

a nonprehensile primitive: vibratory sliding

- asymptotic velocity fields
- velocity fields for rigid bodies

## Outline

a nonprehensile primitive: vibratory sliding

- asymptotic velocity fields
- velocity fields for rigid bodies

## Batting and Sliding

3-DOF "VPOD" vibratory vertical plane manipulator with 3D high-speed vision

## Sliding Manipulation

15 Hz vibration, 20x slow motion

## Sliding Manipulation

square wave vertical and horizontal acceleration

## Sliding Manipulation

square wave vertical and horizontal acceleration

## The 6-DOF PPOD

## (Programmable Parts-feeding Oscillatory Device)

## accelerometers

PPOD2: flexure-based Stewart platform

## The 6-DOF PPOD

(Programmable Parts-feeding Oscillatory Device)

asymptotic average velocity field

## The 6-DOF PPOD

(Programmable Parts-feeding Oscillatory Device)

## Outline

a nonprehensile primitive: vibratory sliding

- asymptotic velocity fields
- velocity fields for rigid bodies

## Part Dynamics

$$
\mathbf{f}_{\mathrm{fric}_{i}}=\mu_{i} N_{i} \frac{\mathbf{v}_{\mathrm{rel}_{i}}}{\left\|\mathbf{v}_{\mathrm{rel}_{i}}\right\|}
$$

- direction of relative velocity between part and plate determines direction of friction force
- vertical acceleration of plate determines normal force and therefore magnitude of friction force
- by exploiting full 6-DOF motion, the direction and magnitude of the friction forces on a part can be made configuration-dependent

## Part Dynamics

## Given:

1. Periodic control signal (plate acceleration)
2. Part parameters (inertia, contact locations)
3. Friction parameters (friction coefficients)

## Part Dynamics

## Given:

1. Periodic control signal (plate acceleration)
2. Part parameters (inertia, contact locations)
3. Friction parameters (friction coefficients)

$$
\begin{aligned}
\dot{x}=f(x, u) \quad & x=\left(q_{\text {plate }}, q_{\text {part }}, v_{\text {plate }}, v_{\text {part }}\right) \\
u & =\dot{v}_{\text {plate }}
\end{aligned}
$$

## Part Dynamics

## Given:

1. Periodic control signal (plate acceleration)
2. Part parameters (inertia, contact locations)
3. Friction parameters (friction coefficients)

$$
\begin{array}{ll}
\dot{x}=f(x, u) & x=\left(q_{\text {plate }}, q_{\text {part }}, v_{\text {plate }}, v_{\text {part }}\right) \\
u=\dot{v}_{\text {plate }}
\end{array}
$$

Simplified dynamics:

1. Sliding at all contacts
2. No Coriolis or centripetal effects
3. Fixed plate and part configurations

## Part Dynamics

## Given:

1. Periodic control signal (plate acceleration)
2. Part parameters (inertia, contact locations)
3. Friction parameters (friction coefficients)

$$
\begin{array}{ll}
\dot{x}=f(x, u) & x=\left(q_{\text {plate }}, q_{\text {part }}, v_{\text {plate }}, v_{\text {part }}\right) \\
u=\dot{v}_{\text {plate }}
\end{array}
$$

Simplified dynamics:

1. Sliding at all contacts
2. No Coriolis or centripetal effects
3. Fixed plate and part configurations

$$
\begin{array}{ll}
\dot{x}=\tilde{f}(x, u) \quad & x=\left(v_{\text {plate }}, v_{\text {part }}\right) \quad \dot{v}_{\text {part }}=\mathbf{A}^{-1} \mathbf{b} \\
u=\dot{v}_{\text {plate }}
\end{array}
$$

## Part Dynamics

## Given:

1. Periodic control signal (plate acceleration)
2. Part parameters (inertia, contact locations)
3. Friction parameters (friction coefficients)

$$
\begin{array}{ll}
\dot{x}=f(x, u) & x=\left(q_{\text {plate }}, q_{\text {part }}, v_{\text {plate }}, v_{\text {part }}\right) \\
u=\dot{v}_{\text {plate }}
\end{array}
$$

Simplified dynamics:

1. Sliding at all contacts
2. No Coriolis or centripetal effects
3. Fixed plate and part configurations

$$
\begin{array}{ll}
\dot{x}=\tilde{f}(x, u) \quad & x=\left(v_{\text {plate }}, v_{\text {part }}\right) \quad \dot{v}_{\text {part }}=\mathbf{A}^{-1} \mathbf{b} \\
& u=\dot{v}_{\text {plate }}
\end{array}
$$

Natural representation of simplified part dynamics:
velocity field on part's configuration space (not force field on plate surface)

## Asymptotic Behavior (Point Part)

Two velocity trajectories (red and blue) for the purple part shown at left, assuming its configuration does not change

$\dot{s}_{x}(\mathrm{~m} / \mathrm{s})$

## Asymptotic Velocity (Point Part)

Asymptotic velocity field for a point part $\mathbf{v}_{a}: \mathbb{R}^{2} \rightarrow \mathbb{R}^{2}$

Asymptotic velocity at configuration $(x, y)$ :

$$
\mathbf{v}_{a}(x, y)=\frac{1}{T} \int_{0}^{T} \mathbf{v}^{L C}(t) d t
$$

Where $\mathbf{v}^{L C}(t)$ is the limit cycle.

## Asymptotic Velocity (Point Part)

Theorem
Given:

- simplified dynamics
- plate oscillation of period $T$

For every (valid) part configuration, the part's velocity trajectory asymptotically converges to a unique limit cycle of period $T$ on or inside the convex hull of the plate's velocity trajectory.

## Asymptotic Velocity (Point Part)

Normal force depends on part

configuration and plate acceleration, but NOT part velocity

## Asymptotic Behavior (Point Part)

Pursuer-Evader: in velocity space, all parts "chase" the plate by moving directly toward it at the same speed

$$
\mathbf{f}_{\text {fric }}=\mu N \frac{\mathbf{v}_{\text {rel }}}{\left\|\mathbf{v}_{\text {rel }}\right\|}
$$

## Example: LineSink

## Asymptotics vs. Experiment

## Asymptotics vs. Full Simulation

LineSink

## Outline

a nonprehensile primitive: vibratory sliding

- asymptotic velocity fields
- velocity fields for rigid bodies

## Asymptotic Behavior (Rigid Parts)

Two velocity trajectories for the purple part shown at left, assuming its configuration does not change

## Asymptotic Velocity (Rigid Parts)

Two velocity trajectories for the purple part shown at left, assuming its configuration does not change

## Sensorless Orienting and Positioning to a Line

## Sensorless Positioning and Orienting

## Sensorless Orientation and Transport

## Full dynamic simulation vs. asymptotic velocity

Red path = part trajectory simulated with full dynamics
Black arrows = asymptotic velocity vectors
Gray arrows = projections of asymptotic velocity vectors

## Experimental data vs. asymptotic velocity

Blue path = part trajectory obtained with an overhead camera
Black arrows = asymptotic velocity vectors
Gray arrows = projections of asymptotic velocity vectors

## Asymptotics vs. Experimental Results

## Outline

a nonprehensile primitive: vibratory sliding

- asymptotic velocity fields
- velocity fields for rigid bodies
- feasible velocity fields for point parts

A_{\varphi, 1} \sin \left(2 \pi f t+\phi_{\varphi, 1}\right)+A_{\varphi, 2} \sin \left(4 \pi f t+\phi_{\varphi, 2}\right) \\
A_{\psi, 1} \sin \left(2 \pi f t+\phi_{\psi, 1}\right)+A_{\psi, 2} \sin \left(4 \pi f t+\phi_{\psi, 2}\right)
\end{array}\right]
$$

$12^{+}$-dimensional space of fields

- All constant fields
- All linear fields
- All quadratic fields?
- others

## Extensions

glass haptic display

- controlling friction

$$
\mathbf{f}_{\text {fric }}=\mu N \frac{\mathbf{v}_{\text {rel }}}{\left\|\mathbf{v}_{\text {rel }}\right\|}
$$

- part interaction, assembly

Colgate, Peshkin, et al.

## Extensions

## - controlling friction

- part interaction, assembly

(world's worst peg-in-hole)
