6.1: Array Practice

a) Write a program that reads 10 numbers from the user, stores them into an array and computes the average. For the use of scanf, use the & as normal: &a[0] will work.

b) Modify your program to read in the number of integers to read from the user, as the first input to your program.

6.2: Array Practice 2

Modify your program from 6.1b to use a function that returns the average of an array passed to it. Pass the size of the array as a parameter.
