# Lambda Calculus Syntax and Semantics

The syntax of a  $\lambda$ -calculus expression is as follows:

$e$	$::=$	$v$	variable
		$\lambda v.e$	functional abstraction
		$(e e)$	function application

The semantics of a  $\lambda$ -calculus expression is called beta-reduction:

$$(\lambda x.E M) \Rightarrow E\{M/x\}$$

where we alpha-rename the lambda abstraction  $E$  if necessary to avoid capturing free variables in  $M$ .

## $\alpha$ -renaming

Alpha renaming is used to prevent capturing free occurrences of variables when beta-reducing a lambda calculus expression.

In the following, we rename  $x$  to  $z$ , (or any other *fresh* variable):

$$\begin{aligned} & (\lambda x. (y x) x) \\ \xrightarrow{\alpha} \quad & (\lambda z. (y z) x) \end{aligned}$$

Only *bound* variables can be renamed. No *free* variables can be captured (become bound) in the process. For example, we *cannot* alpha-rename  $x$  to  $y$ .

# $\beta$ -reduction

$$(\lambda x. E M) \xrightarrow{\beta} E\{M/x\}$$

Beta-reduction may require alpha renaming to prevent capturing free variable occurrences. For example:

$$\begin{aligned} & (\lambda x. \lambda y. (x y) (y w)) \\ \xrightarrow{\alpha} & (\lambda x. \lambda z. (x z) (y w)) \\ \xrightarrow{\beta} & \lambda z. ((y w) z) \end{aligned}$$

Where the *free*  $y$  remains free.

# Booleans and Branching (*if*) in $\lambda$ Calculus

$|true|: \lambda x. \lambda y. x$  (True)

$|false|: \lambda x. \lambda y. y$  (False)

$|if|: \lambda b. \lambda t. \lambda e. ((b\ t)\ e)$  (If)

*Recall semantics rule:*

$(\lambda x. E\ M) \Rightarrow E\{M/x\}$

$$\begin{aligned} & (((\lambda b. \lambda t. \lambda e. ((b\ t)\ e) \lambda x. \lambda y. x) a) b) \\ & \Rightarrow ((\lambda t. \lambda e. ((\lambda x. \lambda y. x\ t)\ e) a) b) \\ & \Rightarrow (\lambda e. ((\lambda x. \lambda y. x\ a)\ e) b) \\ & \Rightarrow ((\lambda x. \lambda y. x\ a) b) \\ & \Rightarrow (\lambda y. a\ b) \\ & \Rightarrow a \end{aligned}$$

# $\eta$ -conversion

$$\lambda x.(E x) \xrightarrow{\eta} E$$

if  $x$  is *not* free in  $E$ .

For example:

$$(\lambda x. \lambda y. (x y) (y w))$$

$$\xrightarrow{\alpha} (\lambda x. \lambda z. (x z) (y w))$$

$$\xrightarrow{\beta} \lambda z. ((y w) z)$$

$$\xrightarrow{\eta} (y w)$$

# Combinators

A lambda calculus expression with *no free variables* is called a *combinator*. For example:

I:	$\lambda x.x$	(Identity)
App:	$\lambda f.\lambda x.(f x)$	(Application)
C:	$\lambda f.\lambda g.\lambda x.(f(g\ x))$	(Composition)
L:	$(\lambda x.(x\ x)\ \lambda x.(x\ x))$	(Loop)
Cur:	$\lambda f.\lambda x.\lambda y.((f\ x)\ y)$	(Currying)
Seq:	$\lambda x.\lambda y.(\lambda z.y\ x)$	(Sequencing--normal order)
ASeq:	$\lambda x.\lambda y.(y\ x)$	(Sequencing--applicative order)

where  $y$  denotes a *thunk*, i.e., a lambda abstraction  
wrapping the second expression to evaluate.

The meaning of a combinator is always the same independently of its context.

# Combinators in Functional Programming Languages

Functional programming languages have a syntactic form for lambda abstractions. For example the identity combinator:

$$\lambda x.x$$

can be written in Oz as follows:

```
fun {$ X} X end
```

in Haskell as follows:

```
\x -> x
```

and in Scheme as follows:

```
(lambda(x) x)
```

# Currying Combinator in Oz

The currying combinator can be written in Oz as follows:

```
fun {$ F}  
    fun {$ X}  
        fun {$ Y}  
            {F X Y}  
        end  
    end  
end
```

It takes a function of two arguments, F, and returns its curried version, e.g.,

$$\{\{\text{Curry Plus}\} 2\} 3 \Rightarrow 5$$

# Recursion Combinator ( $\mathbf{Y}$ or $rec$ )

Suppose we want to express a factorial function in the  $\lambda$  calculus.

$$f(n) = n! = \begin{cases} 1 & n=0 \\ n*(n-1)! & n>0 \end{cases}$$

We may try to write it as:

$$f: \quad \lambda n. (if (= n 0) 1 (* n (f (- n 1))))$$

But  $f$  is a free variable that should represent our factorial function.

# Recursion Combinator (**Y** or *rec*)

We may try to pass  $f$  as an argument ( $g$ ) as follows:

$$f: \lambda g. \lambda n. (if (= n 0) 1 (* n (g (- n 1))))$$

The *type* of  $f$  is:

$$f: (Z \rightarrow Z) \rightarrow (Z \rightarrow Z)$$

So, what argument  $g$  can we pass to  $f$  to get the factorial function?

# Recursion Combinator ( $\mathbf{Y}$ or $rec$ )

$$f: (Z \rightarrow Z) \rightarrow (Z \rightarrow Z)$$

$(ff)$  is not well-typed.

$(fI)$  corresponds to:

$$f(n) = \begin{cases} 1 & n=0 \\ n^*(n-1) & n>0 \end{cases}$$

We need to solve the fixpoint equation:

$$(fX) = X$$

# Recursion Combinator ( $\mathbf{Y}$ or $rec$ )

$$(f X) = X$$

The  $X$  that solves this equation is the following:

$$\begin{aligned} X: \quad & (\lambda x.(\lambda g.\lambda n.(if (= n 0) \\ & \quad \quad \quad I \\ & \quad \quad \quad (* n (g (- n 1))))) \\ & \quad \quad \quad (\lambda y.((x x) y))) \\ & \lambda x.(\lambda g.\lambda n.(if (= n 0) \\ & \quad \quad \quad I \\ & \quad \quad \quad (* n (g (- n 1))))) \\ & \quad \quad \quad (\lambda y.((x x) y))) \end{aligned}$$

# Recursion Combinator ( $Y$ or $rec$ )

$X$  can be defined as  $(Yf)$ , where  $Y$  is the *recursion combinator*.

$$Y: \lambda f.(\lambda x.(f \lambda y.((x x) y))) \\ \quad \quad \quad \lambda x.(f \lambda y.((x x) y)))$$

Applicative  
Order

$$Y: \lambda f.(\lambda x.(f(x x))) \\ \quad \quad \quad \lambda x.(f(x x)))$$

Normal Order

You get from the normal order to the applicative order recursion combinator by  $\eta$ -expansion ( $\eta$ -conversion from right to left).

# Natural Numbers in Lambda Calculus

$$|0|: \lambda x.x \quad (\text{Zero})$$

$$|1|: \lambda x.\lambda x.x \quad (\text{One})$$

...

$$|n+1|: \lambda x.|n| \quad (N+1)$$

$$|s|: \lambda n.\lambda x.n \quad (\text{Successor})$$

(s 0)

$(\lambda n.\lambda x.n \ \underline{\lambda x.x})$

$\Rightarrow \lambda x.\lambda x.x$

*Recall semantics rule:*

$(\lambda x.E \ M) \Rightarrow E\{M/x\}$

# Church Numerals

$$|0|: \lambda f. \lambda x. x$$

(Zero)

$$|1|: \lambda f. \lambda x. (fx)$$

(One)

...

$$|n|: \lambda f. \lambda x. (f \dots (fx) \dots)$$

(N applications of f to x)

$$|s|: \lambda n. \lambda f. \lambda x. (f ((nf)x))$$

(Successor)

$$(s\ 0)$$

*Recall semantics rule:*

$$(\lambda x. E M) \Rightarrow E\{M/x\}$$

$$\begin{aligned} & (\lambda n. \lambda f. \lambda x. (f ((nf)x)) \ \lambda f. \lambda x. x) \\ & \Rightarrow \lambda f. \lambda x. (f ((\underline{\lambda f. \lambda x. x}\ f)x)) \\ & \Rightarrow \lambda f. \lambda x. (f (\underline{\lambda x. x}\ x)) \\ & \Rightarrow \lambda f. \lambda x. (fx) \end{aligned}$$

# Church Numerals: isZero?

*Recall semantics rule:*

$$(\lambda x.E\ M) \Rightarrow E\{M/x\}$$

|isZero?|:  $\lambda n.((n\ \lambda x.\text{false})\ \text{true})$  (Is n=0?)

$$\begin{aligned} & (\text{isZero? } 0) \\ & (\lambda n.((n\ \lambda x.\text{false})\ \text{true})\ \lambda f.\lambda x.x) \\ & \Rightarrow ((\lambda f.\lambda x.x\ \lambda x.\text{false})\ \text{true}) \\ & \Rightarrow (\lambda x.x\ \text{true}) \\ & \Rightarrow \text{true} \end{aligned}$$

$$\begin{aligned} & (\text{isZero? } 1) \\ & (\lambda n.((n\ \lambda x.\text{false})\ \text{true})\ \lambda f.\lambda x.(f\ x)) \\ & \Rightarrow ((\lambda f.\lambda x.(f\ x)\ \lambda x.\text{false})\ \text{true}) \\ & \Rightarrow (\lambda x.(\lambda x.\text{false}\ x)\ \text{true}) \\ & \Rightarrow (\lambda x.\text{false}\ \text{true}) \\ & \Rightarrow \text{false} \end{aligned}$$

# Exercises

9. PDCS Exercise 2.11.10 (page 31). Test your representation of numbers in Haskell.
10. PDCS Exercise 2.11.11 (page 31).
11. Prove that your addition operation is correct using induction.
